CONFIGURATION MANUAL

for UCR11 v2 and Bivias v2 routers

Used symbols

Danger – important notice, which may have an influence on the user's safety or the function of the device.

Attention – notice on possible problems, which can arise in specific cases.

Information, notice – information, which contains useful advice or special interest.

Firmware version

Actual version of firmware is 4.0.0 (11.4.2014).

GPL licence

Source codes under GPL licence are available free of charge by sending an email to:

1. Configuration over web browser

Attention! If the SIM card is not inserted in the router, then wireless transmissions will not work. The inserted SIM card must have activated GPRS. Insert the SIM card when the router is switched-off.

For monitoring, configuring and managing the router use web interface, which can be invoked by entering the IP address of the router into your browser. The default IP address of the router is 192.168.1.1. Configuration may be performed only by the user "root" with initial password "root".

The left part of the web interface contains the menu with pages for monitoring (*Status*), *Configuration*, *Customization* and *Administration* of the router.

Name and *Location* items displays the name and location of the router filled in the SNMP configuration (see SNMP Configuration).

For increased safety of the network managed by the router must be changed the default router password. If the router's default password is set, the **Change password** item is highlighted in red.

Status	General Status

Figure 1: Web configuration

 After green LED starts to blink it is possible to restore initial settings of the router by pressing button RST on front panel. If press button RST, configuration is restored to default and it is reboot (green LED will be on).

1.1 Secured access to web configuration

To the web configuration can be accessed via a secure HTTPS protocol. In the event of a default router IP address is a secure router configuration accessed by entering address `https://192.168.1.1` in the web browser. The first approach is the need to install a security certificate. If your browser reports a disagreement in the domain, this message can be prevented use the following procedure.

Since the domain name in the certificate is given the MAC address of the router (such separators are used dashes instead of colons), it is necessary to access the router under this domain name. For access to the router via a domain name, it is adding a DNS record in the DNS table, the operating system.

- Editing `/etc/hosts` (Linux/Unix)
- Editing `C:\WINDOWS\system32\drivers\etc\hosts` (Windows XP)
- Configuring your own DNS server

In addition to configuring the router with MAC address `00:11:22:33:44:55` is accessed to secure configuration by typing address `https://00-11-22-33-44-55` in the web browser. The first approach is the need to install a security certificate.

 When using self signing certificate must upload your files and `http_cert` `http_key` directory `/etc/certs` in the router.

1.2 General

A summary of basic information about the router and its activities can be invoked by selecting the *General* item. This page is also displayed when you login to the web interface. Information is divided into a several of separate blocks according to the type of router activity or the properties area – *Mobile Connection*, *Primary LAN*, *Peripherals Ports* and *System Information*. If your router is equipped with WIFI expansion port, there is also *WIFI* section.

1.2.1 Mobile Connection

Item	Description
SIM Card	Identification of the SIM card (<i>Primary</i> or <i>Secondary</i>)
Interface	Defines the interface
Flags	Displays network interface flags
IP Address	IP address of the interface

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

Item	Description
MTU	Maximum packet size that the equipment is able to transmit
Rx Data	Total number of received bytes
Rx Packets	Received packets
Rx Errors	Erroneous received packets
Rx Dropped	Dropped received packets
Rx Overruns	Lost received packets because of overload
Tx Data	Total number of sent bytes
Tx Packets	Sent packets
Tx Errors	Erroneous sent packets
Tx Dropped	Dropped sent packets
Tx Overruns	Lost sent packets because of overload
Uptime	Indicates how long the connection to mob. network is established

Table 1: Mobile connection

1.2.2 Primary LAN

Items displayed in this part have the same meaning as items in the previous part. Moreover, there is information about the MAC address of the router (*MAC Address* item).

1.2.3 Peripheral Ports

Item	Description
Expansion Port 1	Expansion port fitted to the position 1 (<i>None</i> indicates that this position is equipped with no port)
Expansion Port 2	Expansion port fitted to the position 2 (<i>None</i> indicates that this position is equipped with no port)
Binary Input	State of binary input
Binary Output	State of binary output

Table 2: Peripheral Ports

1.2.4 System Information

Item	Description
Firmware Version	Information about the firmware version
Serial Number	Serial number of the router (in case of <i>N/A</i> is not available)

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

Item	Description
Profile	Current profile – standard or alternative profiles (profiles are used for example to switch between different modes of operation)
Supply Voltage	Supply voltage of the router
Temperature	Temperature in the router
Time	Current date and time
Uptime	Time indicating how long the router is used

Table 3: System Information

1.3 Mobile WAN status

The *Mobile WAN* menu item contains current information about connections to the mobile network. The first part of this page (*Mobile Network Information*) displays basic information about mobile network in which the router is operated. There is also information about the module, which is mounted in the router.

Item	Description
Registration	State of the network registration
Operator	Specifies the operator in whose network the router is operated
Technology	Transmission technology
PLMN	Code of operator
Cell	Cell to which the router is connected
LAC	Location Area Code – unique number assigned to each location area
Channel	Channel on which the router communicates
Signal Strength	Signal strength of the selected cell
Signal Quality	Signal quality of the selected cell: <ul style="list-style-type: none"> • EC/IO for UMTS and CDMA (it's the ratio of the signal received from the pilot channel – EC – to the overall level of the spectral density, ie the sum of the signals of other cells – IO) • RSRQ for LTE technology (Defined as the ratio $\frac{N \times RSRP}{RSSI}$) • For EDGE technology (router ER75i v2) value is not available
Neighbours	Signal quality of neighboring hearing cells
Manufacturer	Module manufacturer
Model	Type of module

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

Item	Description
Revision	Revision of module
IMEI	IMEI (International Mobile Equipment Identity) number of module
ESN	ESN (Electronic Serial Number) number of module (for CDMA routers)
MEID	MEID (Mobile Equipment Identifier) number of module

Table 4: Mobile Network Information

 Highlighted in red adjacent cells have a close signal quality, which means that there is imminence of frequent switching between the current and the highlighted cell.

The next section of this window displays information about the quality of the connection in each period.

Period	Description
Today	Today from 0:00 to 23:59
Yesterday	Yesterday from 0:00 to 23:59
This week	This week from Monday 0:00 to Sunday 23:59
Last week	Last week from Monday 0:00 to Sunday 23:59
This period	This accounting period
Last period	Last accounting period

Table 5: Description of period

Item	Description
Signal Min	Minimal signal strength
Signal Avg	Average signal strength
Signal Max	Maximal signal strength
Cells	Number of switch between cells
Availability	Availability of the router via mobile network (expressed as a percentage)

Table 6: Mobile Network Statistics

 Tips for *Mobile Network Statistics* table:

- Availability of connection to mobile network is information expressed as a percentage that is calculated by the ratio of time when connection to mobile network is established to the time when the router is turned on.
- After you place your cursor on the maximum or minimum signal strength, the last time when the router reached this signal strength is displayed.

1. CONFIGURATION OVER WEB BROWSER

In the middle part of this page is displayed information about transferred data and number of connections for every SIM card (for each period). The third SIM card is used for CDMA (if router is equipped with a CDMA module) and the remaining SIM cards are standardly designed for LTE/HSPA+ technology (more information about used technologies can be found in the user's guide).

Item	Description
RX data	Total volume of received data
TX data	Total volume of sent data
Connections	Number of connection to mobile network establishment

Table 7: Traffic statistics

The last part (*Mobile Network Connection Log*) informs about the mobile network connection and problems in establishment.

Mobile Network Connection Log

2013-07-10 11:52:40 Connection successfully established.

2013-07-10 21:17:21 Terminated by signal.

2013-07-10 21:18:01 Connection successfully established.

2013-07-11 08:39:20 Terminated by signal.

2013-07-11 08:40:01 Connection successfully established.

2013-07-11 09:22:24 Terminated by signal.

2013-07-11 09:23:08 Connection successfully established.

Figure 2: Mobile WAN status

1.4 WiFi

This item is available only if the router is equipped with a WiFi module.

After selecting the *WiFi* item in the main menu of the web interface, information about WiFi access point (AP) and associated stations is displayed.

Item	Description
hostapd state dump	Time to which statistical data relates
num_sta	Number of connected stations
num_sta_non_erp	Number of connected stations using 802.11b in 802.11g BSS connection
num_sta_no_short_slot_time	Number of stations not supporting the Short Slot Time
num_sta_no_short_preamble	Number of stations not supporting the Short Preamble

Table 8: State information about access point

For each connected client are displayed more detailed information. Most of them has an internal character, so let us mention only the following:

Item	Description
STA	MAC address of connected device (station)
AID	Identifier of connected device (1 – 2007). If 0 is displayed, the station is not currently connected.

Table 9: State information about connected clients

```

WiFi Status
WiFi AP Status

hostapd state dump - Mon Apr 7 12:49:50 2014
num_sta=1 num_sta_non_erp=0 num_sta_no_short_slot_time=1
num_sta_no_short_preamble=0

STA=20:02:af:2a:8f:b1
AID=1 flags=0xa3 [AUTH][ASSOC][AUTHORIZED][SHORT_PREAMBLE]
capability=0x21 listen_interval=10
supported_rates=82 84 0b 16
timeout_next=NULLFUNC POLL

```

Figure 3: WiFi Status

1.5 WiFi Scan

This item is available only if the router is equipped with a WiFi module.

After selecting the *WiFi Scan* item in the menu of the web interface, scanning of neighbouring WiFi networks and subsequent printing of results are invoked. **Scanning can be performed only if the access point (WiFi AP) is off.**

item	Description
BSS	MAC address of access point (AP)
TSF	A Timing Synchronization Function (TSF) keeps the timers for all stations in the same Basic Service Set (BSS) synchronized. All stations shall maintain a local TSF timer.
freq	Frequency band of WiFi network [kHz]
beacon interval	Period of time synchronization
capability	List of access point (AP) properties
signal	Signal level of access point (AP)
last seen	Last response time of access point (AP)
SSID	Identifier of access point (AP)
Supported rates	Supported rates of access point (AP)
DS Parameter set	The channel on which access point (AP) broadcasts
ERP	Extended Rate PHY – information element providing backward compatibility
Extended supported rates	Supported rates of access point (AP) that are beyond the scope of eight rates mentioned in <i>Supported rates</i> item
RSN	Robust Secure Network – The protocol for establishing a secure communication through wireless network 802.11

Table 10: Information about neighbouring WiFi networks

1. CONFIGURATION OVER WEB BROWSER

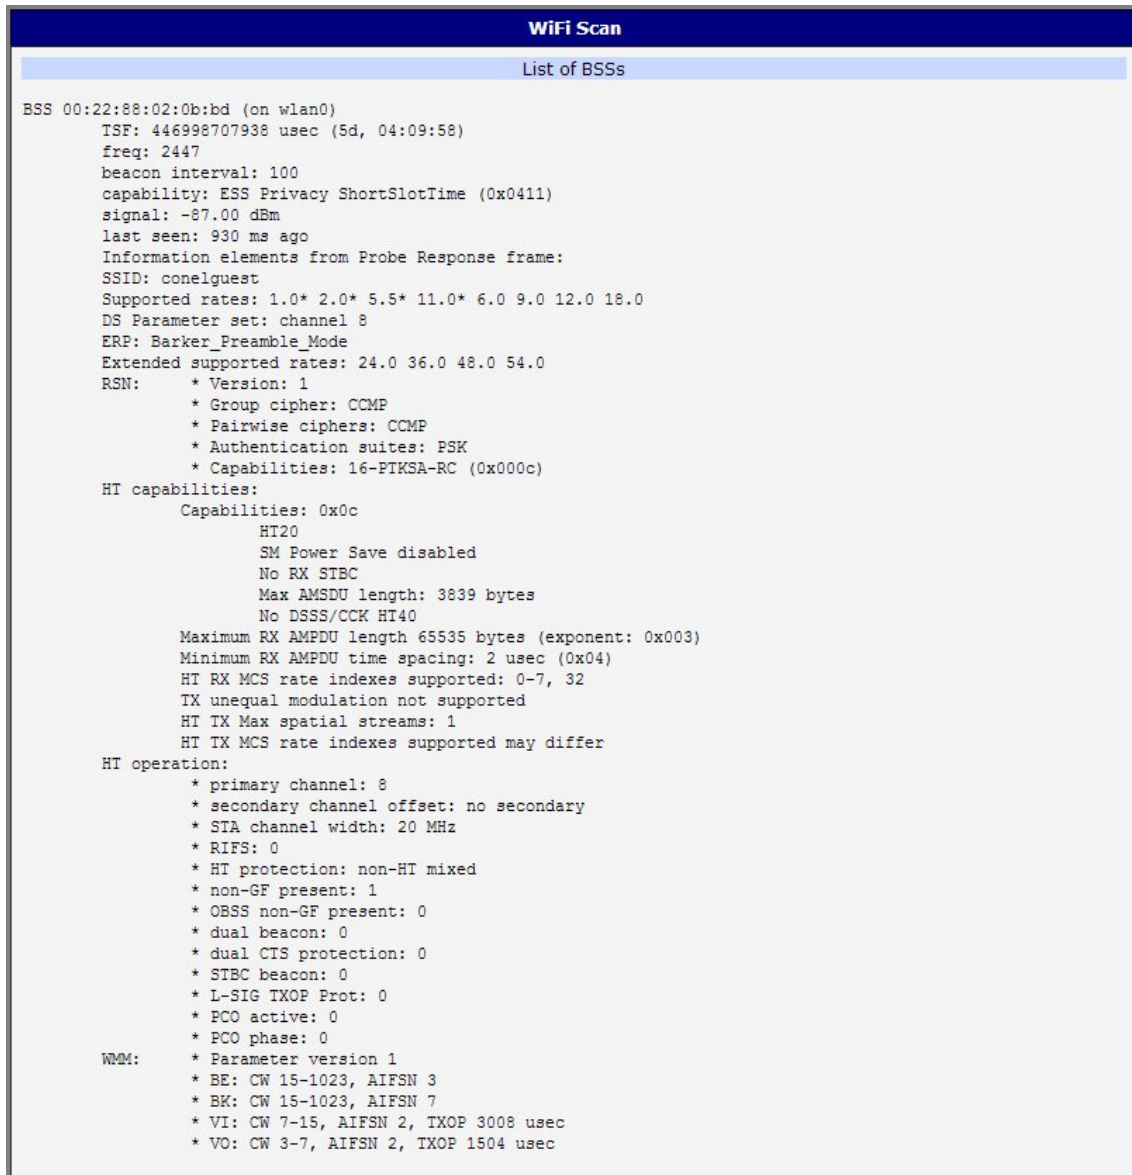

Figure 4: WiFi Scan

1.6 Network status

To view system information about the router operation, select the *Network* item in the main menu. The upper part of the window displays detailed information about active interfaces:

Interface	Description
eth0, eth1	Network interfaces
ppp0	Interface (active connection to GPRS/EDGE)
tun0	OpenVPN tunnel interface
ipsec0	IPSec tunnel interface
gre1	GRE tunnel interface
usb0	USB connector interface

Table 11: Description of interface in network status

By each of the interfaces is then shown the following information:

Item	Description
HWaddr	Hardware (unique) address of networks interface
inet	IP address of interface
P-t-P	IP address second ends connection
Bcast	Broadcast address
Mask	Mask of network
MTU	Maximum packet size that the equipment is able to transmit
Metric	Number of routers, over which packet must go through
RX	<ul style="list-style-type: none"> • packets – received packets • errors – number of errors • dropped – dropped packets • overruns – incoming packets lost because of overload • frame – wrong incoming packets because of incorrect packet size
TX	<ul style="list-style-type: none"> • packets – transmit packets • errors – number of errors • dropped – dropped packets • overruns – outgoing packets lost because of overload • carrier – wrong outgoing packets with errors resulting from the physical layer

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

Item	Description
collisions	Number of collisions on physical layer
txqueuelen	Length of front network device
RX bytes	Total number of received bytes
TX bytes	Total number of transmitted bytes

Table 12: Description of information in network status

It is possible to read status of connection to mobile network from the network information. If the connection to mobile network is active, then it is in the system information shown as a ppp0 interface.

Network Status						
Interfaces						
eth0	Link encap:Ethernet HWaddr 00:11:22:33:44:55 inet addr:192.168.1.1 Bcast:192.168.1.255 Mask:255.255.255.0 UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1 RX packets:407 errors:0 dropped:0 overruns:0 frame:0 TX packets:461 errors:0 dropped:0 overruns:0 carrier:0 collisions:0 txqueuelen:32 RX bytes:51793 (50.5 KB) TX bytes:321807 (314.2 KB) Interrupt:23

Route Table						
Destination	Gateway	Genmask	Flags	Metric	Ref	Use Iface
10.0.0.1	0.0.0.0	255.255.255.255	UH	0	0	0 ppp0
192.168.1.0	0.0.0.0	255.255.255.0	U	0	0	0 eth0
0.0.0.0	10.0.0.1	0.0.0.0	UG	0	0	0 ppp0

Figure 5: Network status

1.7 DHCP status

Information on the activities of the DHCP server can be accessed by selecting the *DHCP status* item.

DHCP status informs about activities DHCP server. The DHCP server provides automatic configuration of devices connected to the network managed router. DHCP server assigns to each device's IP address, netmask, default gateway (IP address of router) and DNS server (IP address of router).

For each configuration, the DHCP status window displays the following information.

Item	Description
lease	Assigned IP address
starts	Time of assignation of IP address
ends	Time of termination IP address validity
hardware ethernet	Hardware MAC (unique) address
uid	Unique ID
client-hostname	Computer name

Table 13: DHCP status description

DHCP Status
Active DHCP Leases (Primary LAN)
<pre>lease 192.168.1.2 { starts 1 2011/01/17 08:08:37; ends 1 2011/01/17 08:18:37; hardware ethernet 00:1d:92:25:72:33; uid 01:00:1d:92:25:72:33; client-hostname "felgr2"; }</pre>
Active DHCP Leases (WLAN)
No active dynamic DHCP leases.

Figure 6: DHCP status

 In the extreme, the DHCP status can display two records for one IP address. That could have been caused by resetting of network cards.

1.8 IPsec status

Information on actual IPsec tunnel state can be called up in option *IPsec* in the menu.

After correct build the IPsec tunnel, status display *IPsec SA established* (highlighted in red) in IPsec status information. Other information is only internal character.

IPsec Status	
IPsec Tunnels Information	
<pre> interface eth0/eth0 192.168.2.250 interface ppp0/ppp0 10.0.0.132 %myid = (none) debug none "ipsecl": 192.168.2.0/24==10.0.0.132...10.0.1.228==192.168.1.0/24; erouted; eroute owner: #2 "ipsecl": myip=unset; hisip=unset; myup=/etc/scripts/updown; hisup=/etc/scripts/updown; "ipsecl": ike_life: 3600s; ipsec_life: 3600s; rekey_margin: 540s; rekey_fuzz: 100%; keyingtries: 0 "ipsecl": policy: PSK+ENCRYPT+TUNNEL+UP; prio: 24,24; interface: ppp0; "ipsecl": newest ISAKMP SA: #1; newest IPsec SA: #2; "ipsecl": IKE algorithm newest: AES_CBC_128-SHA1-MODP2048 #2: "ipsecl":500 STATE_QUICK_I2 (sent QI2, IPsec SA established); EVENT_SA_REPLACE in 2708s; newest IPSEC; erout #2: "ipsecl" esp.d07e3080@10.0.1.228 esp.783be7ee@10.0.0.132 tun.0@10.0.1.228 tun.0@10.0.0.132 ref=0 reftim=4294 #1: "ipsecl":500 STATE_MAIN_I4 (ISAKMP SA established); EVENT_SA_REPLACE in 2733s; newest ISAKMP; lastdpd=-1s(se </pre>	

Figure 7: IPsec status

1.9 DynDNS status

DynDNS up – dating entry result on server www.dyndns.org can be called up in option *DynDNS* item in the menu.

DynDNS Status
Last DynDNS Update Status
DynDNS record successfully updated.

Figure 8: DynDNS status

In detecting the status of updates DynDNS record are possible following message:

- DynDNS client is disabled.
- Invalid username or password.
- Specified hostname doesn't exist.
- Invalid hostname format.
- Hostname exists, but not under specified username.
- No update performed yet.
- DynDNS record is already up to date.

- DynDNS record successfully update.
- DNS error encountered.
- DynDNS server failure.

 For correct function DynDNS, SIM card of router must have assigned public IP address.

1.10 System Log

In case of any problems with connection to GPRS it is possible to view the system log by pressing the *System Log* menu item. In the window, are displayed detailed reports from individual applications running in the router. Use the *Save Log* button to save the system log to a connected computer. The second button – *Save Report* – is used for creating detailed report (generates all support needed information in one file).

The Syslog default size is 1000 lines. After reaching 1000 lines create a new file for storing system log. After completion of the 1000 lines in the second file, the first file is deleted and creates a new one.

Program syslogd can be started with two options that modifies its behavior. Option "-s" followed by decimal number set maximal number of lines in one log file. Option "-r" followed by hostname or IP address enable logging to remote syslog daemon. In the Linux must be enabled remote logging on the target computer. Typically running syslogd with the parameter "-r". On Windows must be installed the syslog server (for example Syslog Watcher). For starting syslogd with these options you could modify script "/etc/init.d/syslog" or add lines "killall syslogd" and "syslogd <options> &" into Startup Script.

1. CONFIGURATION OVER WEB BROWSER

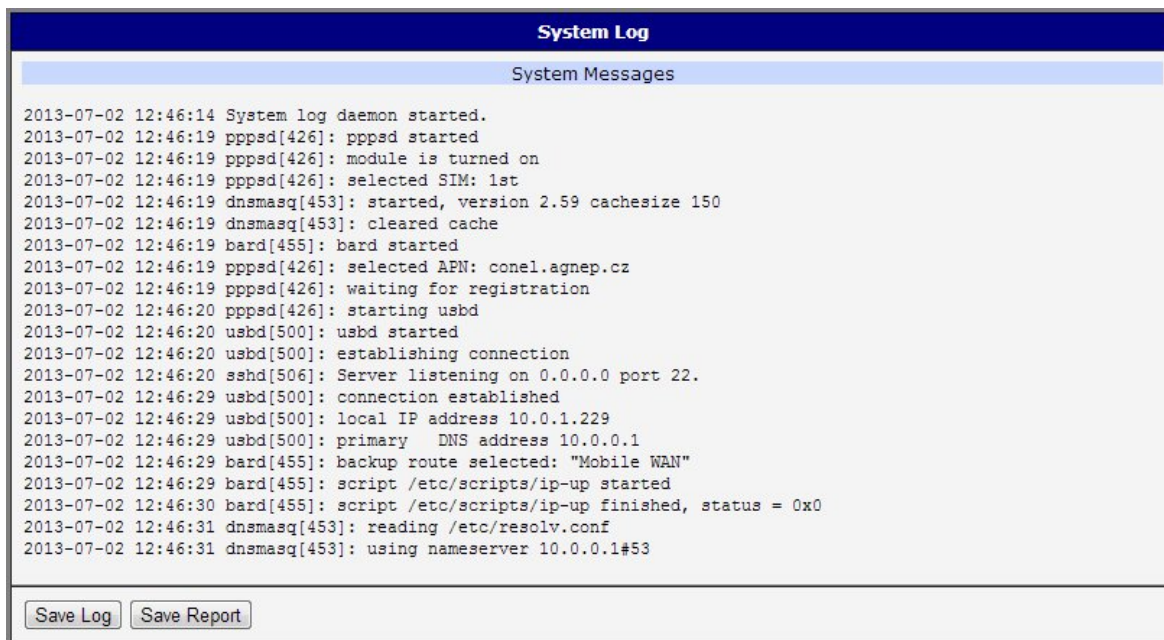

Figure 9: System Log

Example of logging into the remote daemon at 192.168.2.115:

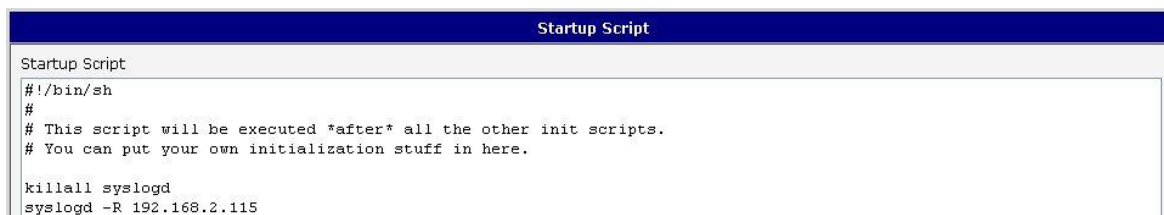

Figure 10: Example program syslogd start with the parameter -r

1.11 LAN configuration

To enter the network configuration, select the *LAN* menu item. ETH network set in *Primary LAN* configuration, expansion PORT ETH set in *Secondary LAN* configuration.

Item	Description
DHCP Client	<ul style="list-style-type: none"> • disabled – The router does not allow automatic allocation IP address from a DHCP server in LAN network. • enabled – The router allows automatic allocation IP address from a DHCP server in LAN network.

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

Item	Description
IP address	Fixed set IP address of network interface ETH.
Subnet Mask	IP address of Subnet Mask.
Bridged	<ul style="list-style-type: none"> • no – router is not used as a bridge (default) • yes – router is used as a bridge
Media type	<ul style="list-style-type: none"> • Auto-negation – The router selects the speed of communication of network options. • 100 Mbps Full Duplex – The router communicates at 100Mbps, in the full duplex mode. • 100 Mbps Half Duplex – The router communicates at 100Mbps, in the half duplex mode. • 10 Mbps Full Duplex – The router communicates at 10Mbps, in the full duplex mode. • 10 Mbps Half Duplex – The router communicates at 10Mbps, in the half duplex mode.
Default Gateway	IP address of router default gateway. When entering IP address of default gateway, all packets for which the record was not found in the routing table, sent to this address.
DNS server	IP address of DNS server of router. Address where they are forwarded to all DNS questions on the router.

Table 14: Configuration of network interface

Default Gateway and *DNS Server* items are used only if the *DHCP Client* item is set to a value *disabled* and if the Primary or Secondary LAN is selected by Backup routes system as a default route (selection algorithm is described in section 1.16 *Backup Routes*).

There can be only one active bridge on the router at the moment. Only parameters DHCP Client, IP address and Subnet Mask can be used to configure bridge. Primary LAN has got higher priority in this respect when both interfaces (eth0, eth1) are added to the bridge. Other interfaces (wlan0 – wifi) can be added (or deleted) to (from) existing bridge at any moment. Moreover, the bridge can be created on demand of such interfaces but not configured by their respective parameters.

DHCP server assigns IP address, gateway IP address (IP address of the router) and IP address of the DNS server (IP address of the router) to the connected clients.

DHCP server supports static and dynamic assignment of IP addresses. Dynamic DHCP server assigns clients IP addresses from a defined address space. Static DHCP assigns IP addresses that correspond to the MAC addresses of connected clients.

1. CONFIGURATION OVER WEB BROWSER

Item	Description
Enable dynamic DHCP leases	If this option is checked, dynamic DHCP server is enable.
IP Pool Start	Start IP addresses space to be allocated to the DHCP clients.
IP Pool End	End IP addresses space to be allocated to the DHCP clients.
Lease time	Time in seconds, after which the client can use IP address.

Table 15: Configuration of dynamic DHCP server

Item	Description
Enable static DHCP leases	If this option is checked, static DHCP server is enable.
MAC Address	MAC address of a DHCP client.
IP Address	Assigned IP address.

Table 16: Configuration of static DHCP server

 It is important not to overlap ranges of static allocated IP address with address allocated by the dynamic DHCP. Then risk collision of IP addresses and incorrect function of network.

Example of the network interface with dynamic DHCP server:

- The range of dynamic allocated addresses from 192.168.1.2 to 192.168.1.4.
- The address is allocated 600 second (10 minutes).

Figure 16: Example LAN configuration 3

1.12 VRRP configuration

To enter the VRRP configuration select the *VRRP* menu item. VRRP protocol (Virtual Router Redundancy Protocol) is a technique, by which it is possible to forward routing from main router to backup router in the case of the main router failure. If the *Enable VRRP* is checked, then it is possible to set the following parameters.

Item	Description
Virtual Server IP Address	This parameter sets virtual server IP address. This address should be the same for both routers. A connected device sends its data via this virtual address.
Virtual Server ID	Parameter Virtual Server ID distinguishes one virtual router on the network from others. Main and backup routers must use the same value for this parameter.
Host Priority	The router, with higher priority set by the parameter Host Priority, is the main router. According to RFC 2338 the main router has the highest possible priority - 255. The backup router has priority in range 1 – 254 (init value is 100). The priority value equals 0 is not allowed.

Table 17: VRRP configuration

It is possible to set *Check connection* flag in the second part of the window. The currently active router (main/backup) will send testing messages to defined *Ping IP Address* at periodic time intervals (*Ping Interval*) with setting time of waiting for answer (*Ping Timeout*). The function check connection is used as a supplement of VRRP standard with the same final result. If there are no answers from remote devices (*Ping IP Address*) for a defined number of probes (*Ping Probes*), then connection is switched to the other line.

Item	Description
Ping IP Address	Destinations IP address ping queries. Address can not specify as domain name.
Ping Interval	Time intervals between the outgoing pings.
Ping Timeout	Time to wait to answer.
Ping Probes	Number of failed ping requests, after which the route is considered to be impassable.

Table 18: Check connection

Ping IP address is possible to use for example a DNS server of mobile operator as a test message (ping) IP address.

There's an additional way for evaluating the state of the active line. It is activated by selecting *Enable traffic monitoring* parameter. If this parameter is set and any packet different from ping is sent to the monitored line, then any answer to this packet is expected for *Ping Timeout*.

1. CONFIGURATION OVER WEB BROWSER

If *Ping Timeout* expires with no answer received then process of testing the active line continues the same way like in the case of standard testing process after first test message answer drops out.

Example of the VRRP protocol:

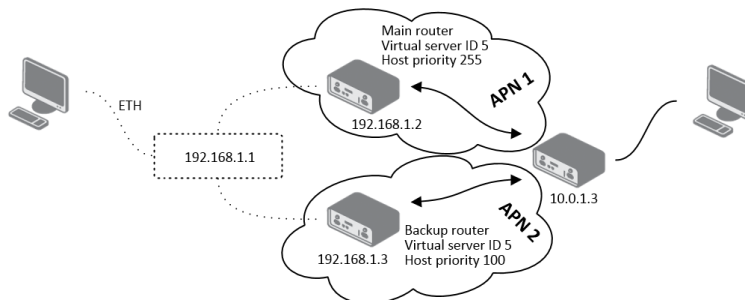

Figure 17: Topology of example VRRP configuration

VRRP Configuration	
<input checked="" type="checkbox"/> Enable VRRP	
Virtual Server IP Address	192.168.1.1

Ping Timeout	5 sec
Ping Probes	10
<input type="checkbox"/> Enable traffic monitoring	
<input type="button" value="Apply"/>	

Figure 19: Example VRRP configuration -- backup router

1.13 Mobile WAN configuration

The form for configuration of a connection to the mobile network can be invoked by selecting the *Mobile WAN* item in the main menu of the router web interface.

1.13.1 Connection to mobile network

If the *Create connection to mobile network* item is selected, the router automatically tries to establish connection after switching-on.

Item	Description
APN	Network identifier (Access Point Name)
Username	User name to log into the GSM network
Password	Password to log into the GSM network
Authentication	Authentication protocol in GSM network: <ul style="list-style-type: none"> • PAP or CHAP – authentication method is chosen by router • PAP – it is used PAP authentication method • CHAP – it is used CHAP authentication method
IP Address	IP address of SIM card. The user sets the IP address, only in the case IP address was assigned of the operator.
Phone Number	Telephone number to dial GPRS or CSD connection. Router as a default telephone number used *99***1 #.
Operator	This item can be defined PLMN preferred carrier code
Network type	<ul style="list-style-type: none"> • Automatic selection – router automatically selects transmission method according to the availability of transmission technology • <i>Furthermore, according to the type of router</i> – it's also possible to select a specific method of data transmission (GPRS, UMTS, ...)
PIN	PIN parameter should be set only if it requires a SIM card router. SIM card is blocked in case of several bad attempts to enter the PIN.
MRU	Maximum Receiving Unit – It's an identifier of maximum size of packet, which is possible to receive in a given environment. Default value is 1500 B. Other settings may cause incorrect transmission of data.
MTU	Maximum Transmission Unit – It's an identifier of max. size of packet, which is possible to transfer in a given environment. Default value is 1500 B. Other settings may cause incorrect transmission of data.

Table 19: Mobile WAN connection configuration

Tips for working with the *Mobile WAN* configuration form:

- If the size is set incorrectly, data transfer may not be succeeded. By setting a lower MTU it occurs to more frequent fragmentation of data, which means higher overhead and also the possibility of damage of packet during defragmentation. On the contrary, the higher value of MTU can cause that the network does not transfer the packet.
- If the *IP address* field is not filled in, the operator automatically assigns the IP address when it is establishing the connection. If filled IP address supplied by the operator, router accelerate access to the network.
- If the *APN* field is not filled in, the router automatically selects the APN by the IMSI code of the SIM card. If the PLMN (operator number format) is not in the list of APN, then default APN is "internet". The mobile operator defines APN.

ATTENTION:

- **Correct PIN must be filled. For SIM cards with two APN's there will be the same PIN for both APN's. Otherwise the SIM card can be blocked by false SIM PIN.**

Items marked with an asterisk must be filled in only if this information is required by the operator (carrier).

In case of unsuccessful establishing a connection to mobile network is recommended to check the accuracy of entered data. Alternatively, try a different authentication method or network type.

1.13.2 DNS address configuration

The *DNS Settings* item is designed for easier configuration on the client side. When this item is set to the value *get from operator* router makes an attempt to automatically get an IP address of the primary and secondary DNS server from the operator. By way of contrast, *set manually* option allows you to set IP addresses of Primary DNS servers manually (using the *DNS Server* item).

1.13.3 Check connection to mobile network configuration

If the *Check Connection* item is set to *enabled* or *enabled + bind*, checking the connection to mobile network is activated. Router will automatically send ping requests to the specified domain or IP address (*Ping IP Address* item) in regular time interval (*Ping Interval*). In case of unsuccessful ping, a new one will be sent after ten seconds. If it fails to ping the IP address of three times in a row, the router terminates the current connection and tries to establish new ones. Checking can be set separately for two SIM cards or two APNs. As a ping address can be used an IP address for which it is certain that it is still functional and is possible to send ICMP ping (e.g. DNS server of operator).

1. CONFIGURATION OVER WEB BROWSER

In the case of the *enabled* option ping requests are sent on the basis of routing table. Thus, the requests may be sent through any available interface. If you require each ping request to be sent through the network interface, which was created on the occasion of establishing a connection to the mobile operator, it is necessary to set the *Check Connection* item to *enabled + bind*. The *disabled* variant deactivates checking the connection to mobile network.

Item	Description
Ping IP Address	Destinations IP address or domain name of ping queries.
Ping Interval	Time intervals between the outgoing pings.
Ping Timeout	Defines the time interval during which the router waits for a message sent by the counterparty. <i>Ping Timeout</i> should be greater than <i>Ping Interval</i>

Table 20: Check connection to mobile network configuration

If the *Enable Traffic Monitoring* option is selected, then the router stops sending ping questions to the Ping IP Address and it will watch traffic in connection to mobile network. If this connection is without traffic longer than the Ping Interval, then the router sends ping questions to the Ping IP Address.

 **Attention!** The feature of check connection to mobile network is necessary for uninterrupted operation.

1.13.4 Data limit configuration

Item	Description
Data limit	With this parameter you can set the maximum expected amount of data transmitted (sent and received) over GPRS in one billing period (month).
Warning Threshold	Parameter <i>Warning Threshold</i> determine per cent of Data Limit in the range of 50% to 99%, which if is exceeded, then the router sends SMS in the form <i>Router has exceeded (value of Warning Threshold) of data limit</i> .
Accounting Start	Parameter sets the day of the month in which the billing cycle starts SIM card used. Start of the billing period defines the operator, which gives the SIM card. The router begin to count the transferred data since that day.

Table 21: Data limit configuration

 If parameters *Switch to _____ when data limit is exceeded* and *switch to default SIM card when data limit isn't exceeded* (see next subsection) or *Send SMS when datalimit is exceeded* (see SMS configuration) are not selected the data limit will not count.

1.13.5 Switch between SIM cards configuration

At the bottom of configuration it is possible to set rules for switching between three SIM cards (or between APNs). The third SIM card is used for CDMA (if the router is equipped with WIFI) and the remaining SIM cards are standardly designed for LTE/HSPA+ (more information about used technologies can be found in the user's guide).

Item	Description
Priority	This parameter sets default SIM card, from which it will try to establish the connection to mobile network. If this parameter is set to <i>not set</i> , the router launches in offline mode and it is necessary to establish connection to mobile network via SMS message.

Table 22: Default SIM card configuration

Item	Description
Switch to other SIM card when connection fails	If connection to mobile network fails, then this parameter ensures switch to secondary SIM card or secondary APN of the SIM card. Failure of the connection to mobile network can occur in two ways. When I start the router, when three fails to establish a connection to mobile network. Or if it is checked Check the connection to mobile network, and is indicated by the loss of a connection to mobile network.
Switch to _____ when roaming is detected and switch to default SIM card when home network is detected	In case that the roaming is detected this parameter enables switching to specified SIM card or APN. If home network is detected, this parameter enables switching back to default SIM card. For proper operation, it is necessary to have enabled roaming on your SIM card!
Switch to _____ when data limit is exceeded and switch to default SIM card when data limit isn't exceeded	This parameter enables switching to specified SIM card or APN, when the data limit of default APN is exceeded. This parameter also enables switching back to default SIM card, when data limit is not exceeded.
Switch to _____ when binary input is active switch to default SIM card when binary input isn't active	This parameter enables switching to specified SIM card or APN, when binary input 'bin0' is active. If binary input isn't active, this parameter enables switching back to default SIM card.

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

Item	Description
Switch to SIM card on the other module when sig. strength drops below "weak" level (and is above "fair" level on target config.) and switch to default SIM card when sig. strength is above "fair" level	This parameter enables switching to specified SIM card or APN, when the signal strength drops below specified value (and is above specified value on target configuration). If the signal strength is above specified value, this parameter enables switching back to default SIM card.
Switch to default SIM card after timeout	This parameter defines the method, how the router will try to switch back to default SIM card or default APN.

Table 23: Switch between SIM card configurations

Switching between SIM cards on the ground of signal strength is performed according to the **"weak"** (lower limit) and **"fair"** (upper limit) values. It is possible to define the following properties:

Item	Description
Levels for GPRS/EDGE	Limits for GRPS/EDGE technology
Levels for UMTS/HSPA+	Limits for UMTS/HSPA+ technology
Levels for CDMA	Limits for CDMA technology
Sampling Interval	The frequency of making samples
Filter Width	Filter width for calculating the moving average from loaded values of signal strength. The first value indicates the fewest number of loaded samples for which the value of calculated average is valid and can be used to evaluate the relevant condition. The second value is a filter width in the steady state when the moving average algorithm is applied (ie. if another sample is loaded, replaces the oldest one, which means that the filter width remains constant).

Table 24: Properties defining switching between SIM cards

The following parameters define the time after which the router attempts to go back to the default SIM card or APN.

Item	Description
Initial timeout	The first attempt to switch back to the primary SIM card or APN shall be made for the time defined in the parameter Initial Timeout, range of this parameter is from 1 to 10000 minutes.

Continued on next page

Continued from previous page

Item	Description
Subsequent Timeout	In an unsuccessful attempt to switch to default SIM card, the router on the second attempt to try for the time defined in the parameter Subsequent Timeout, range is from 1 to 10000 min.
Additive constants	Any further attempt to switch back to the primary SIM card or APN shall be made in time computed as the sum of the previous time trial and time defined in the parameter Additive constants range is 1-10000 minutes.

Table 25: Switch between SIM card configurations

Example:

If parameter *Switch to default SIM card after timeout* is checked and parameters are set as follows: *Initial Timeout* – 60 min, *Subsequent Timeout* 30 min and *Additive Timeout* – 20 min, the first attempt to switch the primary SIM card or APN shall be carried out after 60 minutes. Switched to a failed second attempt made after 30 minutes. Third after 50 minutes (30+20). Fourth after 70 minutes (30+20+20).

1.13.6 PPPoE bridge mode configuration

If the *Enable PPPoE bridge mode* option selected, it activate the PPPoE bridge protocol PPPoE (point-to-point over ethernet) is a network protocol for encapsulating Point-to-Point Protocol (PPP) frames inside Ethernet frames. Allows you to create a PPPoE connection from the device behind router. For example from PC which is connected to ETH port router. There will be allot Ip address of SIM card to PC.

The changes in settings will apply after pressing the *Apply* button.

Figure 20: Mobile WAN configuration

1. CONFIGURATION OVER WEB BROWSER

The figure below describes the situation, when the connection to mobile network is controlled on the address 8.8.8.8 in the time interval of 60 s for primary SIM card and on the address www.google.com in the time interval 80 s for secondary SIM card. In the case of traffic on the router the control pings are not sent, but the traffic is monitored.

(The feature of check connection to mobile network is necessary for uninterrupted operation)

Check Connection	enabled	enabled	disabled
Ping IP Address	8.8.8.8	www.google.com	
Ping Interval	60	80	sec
Ping Timeout	10	10	10 sec

☒ Enable traffic monitoring

Figure 21: Example of Mobile WAN configuration 1

The following configuration illustrates the situation in which the router switches to the third SIM card after exceeding the data limits of 800 MB. Warning SMS is sent upon reaching 400 MB. The start of accounting period is set to the 18th day of the month.

Data Limit	800	MB
Warning Threshold	50	%
Accounting Start	18	

Priority	1st	2nd	3rd
----------	-----	-----	-----

Default SIM card: 1st (determined by priority)

☐ Switch to SIM card with lower priority when connection fails

☐ Switch to offline mode when roaming is detected and switch to default SIM card when home network is detected

☒ Switch to 3rd SIM card when data limit is exceeded and switch to default SIM card when data limit isn't exceeded

☐ Switch to offline mode when binary input is active and switch to default SIM card when binary input isn't active

☐ Switch to SIM card on the other module when signal strength drops below "weak" level (and is above "fair" level on target configuration) and switch to default SIM card when signal strength is above "fair" level

	weak	fair	
Levels for GPRS/EDGE	-90	-80	dBm
Levels for UMTS/HSPA	-100	-90	dBm
Levels for CDMA	-90	-80	dBm

Sampling Interval: 10 sec

Filter Width: 4 / 16 samples

☐ Switch to default SIM card after timeout

Initial Timeout: 60 min

Subsequent Timeout *: min

Additive Constant *: min

Figure 22: Example of Mobile WAN configuration 2

1. CONFIGURATION OVER WEB BROWSER

Default SIM card is switched to the offline mode after the router detects roaming. The first attempt to switch back to the default SIM card is executed after 60 minutes, the second after 40 minutes, the third after 50 minutes (40+10) etc.

Priority	1st	2nd	3rd
Default SIM card: 1st (determined by priority)			
<input type="checkbox"/> Switch to SIM card with lower priority when connection fails			
<input checked="" type="checkbox"/> Switch to offline mode when roaming is detected and switch to default SIM card when home network is detected

Figure 23: Example of Mobile WAN configuration 3

1.14 WiFi configuration

This item is available only if the router is equipped with a WiFi module.

The form for configuration of WiFi network can be invoked by pressing the *WiFi* item in the main menu of the router web interface. *Enable WiFi* check box at the top of this form is used to activate WiFi. It is also possible to set the following properties:

Item	Description
Operating mode	<p>WiFi operating mode:</p> <ul style="list-style-type: none"> • access point (AP) – router becomes an access point to which other devices in <i>station (STA)</i> mode can be connected • station (STA) – router becomes a client station, it means that receives data packets from the available access point (AP) and sends data from cable connection via wifi network
SSID	Unique identifier of WiFi network
Broadcast SSID	<p>Method of broadcasting the unique identifier of SSID network in beacon frame and type of response to a request for sending the beacon frame.</p> <ul style="list-style-type: none"> • Enabled – SSID is broadcasted in beacon frame • Zero length – Beacon frame does not include SSID. Requests for sending beacon frame are ignored. • Clear – Each SSID character in beacon frame is replaced by 0. However, original length is kept. Requests for sending beacon frame are ignored.
Country Code	<p>Code of the country, where the router is used with WiFi. This code must be entered in format ISO 3166-1 alpha-2. If <i>country code</i> isn't specified and the router has implemented no system to determine this code, it is used "US" as default <i>country code</i>.</p> <p>If no <i>country code</i> is specified or is entered the wrong country code, then it may come a pass a breach of regulatory rules for the using of frequency bands in the particular country.</p>

1.15 WLAN configuration

This item is available only if the router is equipped with a WiFi module.

The form for configuration of WiFi network and DHCP server functioning on this network can be invoked by pressing the *WLAN* item in the main menu of the router web interface. *Enable WLAN interface* check box at the top of this form is used to activate WiFi LAN interface. It is also possible to set the following properties:

Item	description
Operating Mode	<p>WiFi operating mode:</p> <ul style="list-style-type: none"> • access point (AP) – router becomes an access point to which other devices in <i>station (STA)</i> mode can be connected • station (STA) – router becomes a client station, it means that receives data packets from the available access point (AP) and sends data from cable connection via wifi network
DHCP Client	Activates/deactivates DHCP client
IP Address	Fixed set IP address of WiFi network interface
Subnet Mask	Subnet mask of WiFi network interface
Bridged	<p>Activates bridge mode:</p> <ul style="list-style-type: none"> • no – Bridged mode is not allowed (it's default value). WLAN network is not connected with LAN network of the router. • yes – Bridged mode is allowed. WLAN network is connected with one or more LAN network of the router. In this case, the setting of most items in this table is ignored. Instead, it takes setting of selected network interface (LAN).
Default Gateway	IP address of default gateway. When entering IP address of default gateway, all packets for which the record was not found in the routing table are sent to this address.
DNS Server	Address to which all DNS queries are forwarded

Table 27: WLAN configuration

1. CONFIGURATION OVER WEB BROWSER

Use *Enable dynamic DHCP leases* item at the bottom of this form to enable dynamic allocation of IP addresses using DHCP server. It is also possible to specify these values:

Item	Description
IP Pool Start	Beginning of the range of IP addresses which will be assigned to DHCP clients
IP Pool End	End of the range of IP addresses which will be assigned to DHCP clients
Lease Time	Time in seconds for which the client may use the IP address

Table 28: Configuration of DHCP server

IP Pool End	192.168.3.254
Lease Time	600 sec
<input type="button" value="Apply"/>	

Figure 25: WLAN configuration

1.16 Backup Routes

Using the configuration form on the *Backup Routes* page can be set backing up primary connection by other connections to internet/mobile network. For each back up connection can be defined a priority. Own switching is done based on set priorities and state of the connection (for *Primary LAN* and *Secondary LAN*).

If *Enable backup routes switching* option is checked, the default route is selected according to the settings below. Namely according to status of enabling each of backup route (i.e. *Enable backup routes switching for Mobile WAN*, *Enable backup routes switching for WiFi STA*, *Enable backup routes switching for Primary LAN*, *Enable backup routes switching for Secondary LAN* or *Enable backup routes switching for PPPoE*), according to explicitly set priorities and according to status of connection check (if it is enabled). In addition, network interfaces belonging to individual backup routes have checked a flag *RUNNING*. This check fixes for example disconnecting of an ethernet cable.

If *Enable backup routes switching* option is not checked, Backup routes system operates in the so-called backward compatibility mode. The default route is selected based on implicit priorities according to the status of enabling settings for each of network interface, as the case may be enabling services that set these network interfaces. Names of backup routes and corresponding network interfaces in order of implicit priorities:

- Mobile WAN (pppX, usbX)
- PPPoE (ppp0)
- Secondary LAN (eth1)
- Primary LAN (eth0)

Example:

Secondary LAN is selected as the default route only if *Create connection to mobile network* option is not checked on the *Mobile WAN* page, alternatively if *Create PPPoE connection* option is not checked on the *PPPoE* page. To select the Primary LAN it is also necessary not to be entered *IP address* for Secondary LAN and must not be enabled *DHCP Client* for Secondary LAN.

Item	Description
Priority	Priority for the type of connection
Ping IP Address	Destination IP address of ping queries to check the connection (address can not be specified as a domain name)
Ping Interval	The time intervals between sent ping queries

Table 29: Backup Routes

All changes in settings will be applied after pressing the *Apply* button.

1.17 Firewall configuration

The first security element which incoming packets must pass is check of enabled source IP addresses and destination ports. It can be specified IP addresses from which you can remotely access the router and the internal network connected behind a router. If the *Enable filtering of incoming packets* item is checked (located at the beginning of the configuration form *Firewall*), this element is enabled and accessibility is checked against the table with IP addresses. This means that access is permitted only addresses specified in the table. It is possible to define up to eight remote accesses. There are the following parameters:

Item	Description
Source	IP address from which access to the router is allowed
Protocol	<p>Specifies protocol for remote access:</p> <ul style="list-style-type: none"> • all – access is enabled for all protocols • TCP – access is enabled for TCP protocol • UDP – access is enabled for UDP protocol • ICMP – access is enabled for ICMP protocol

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

Item	Description
Target Port	The port number on which access to the router is allowed
Action	Type of action: <ul style="list-style-type: none"> • allow – access is allowed • deny – access is denied

Table 30: Filtering of incoming packets

The following part of the configuration form defines the forwarding policy. If *Enabled filtering of forwarded packets* item is not checked, packets are automatically accepted. If this item is checked and incoming packet is addressed to another network interface, it will go to the FORWARD chain. In case that the FORWARD chain accepted this packet (there is a rule for its forwarding), it will be sent out. If the forwarding rule does not exist, packet will be dropped.

Then there is a table for defining the rules. It is possible to allow all traffic within the selected protocol (rule specifies only protocol) or create stricter rules by specifying items for source IP address, destination IP address and port.

Položka	Popis
Source	IP address of source device
Destination	IP address of destination device
Protocol	Specifies protocol for remote access: <ul style="list-style-type: none"> • all – access is enabled for all protocols • TCP – access is enabled for TCP protocol • UDP – access is enabled for UDP protocol • ICMP – access is enabled for ICMP protocol
Target Port	The port number on which access to the router is allowed
Action	Type of action: <ul style="list-style-type: none"> • allow – access is allowed • deny – access is denied

Table 31: Forwarding filtering

There is also the possibility to drop a packet whenever request for service which is not in the router comes (checkbox named *Enable filtering of locally destined packets*). The packet is dropped automatically without any information.

1. CONFIGURATION OVER WEB BROWSER

As a protection against DoS attacks (this means attacks during which the target system is flooded with plenty of meaningless requirements) is used option named *Enable protection against DoS attacks* which limits the number of connections per second for five.

<input checked="" type="checkbox"/> Enable filtering of incoming packets			
Source *	Protocol	Target Port *	Action
<input checked="" type="checkbox"/> 171.92.5.45	all		allow
<input checked="" type="checkbox"/> 10.0.2.123	TCP	1000	allow
<input checked="" type="checkbox"/> 142.2.26.54	ICMP		allow
<input type="checkbox"/>	all		allow
<input type="checkbox"/>	all		allow
<input type="checkbox"/>	all		allow
<input type="checkbox"/>	all		allow
<input type="checkbox"/>	all		allow

Figure 29: Example firewall configuration

1.18 NAT configuration

To enter the Network Address Translation configuration, select the *NAT* menu item. NAT (Network address Translation / Port address Translation - PAT) is a method of adjusting the network traffic through the router default transcript and/or destination IP addresses often change the number of TCP/UDP port for walk-through IP packets. The window contains sixteen entries for the definition of NAT rules.

Item	Description
Public Port	Public port
Private Port	Private port
Type	Protocol selection
Server IP address	IP address which will be forwarded incoming data

Table 32: NAT configuration

If necessary set more than sixteen rules for NAT rules, then is possible insert into start up script following script:

```
iptables -t nat -A napt -p tcp --dport [PORT\_PUBLIC] -j DNAT --to-destination [IPADDR] : [PORT1\_PRIVATE]
```

Concrete IP address [IPADDR] and ports numbers [PORT_PUBLIC] and [PORT_PRIVATE] are filled up into square bracket.

The following items are used to set the routing of all incoming traffic from the PPP to the connected computer.

Item	Description
Send all remaining incoming packets to default server	By checking this item and setting the Default Server item it is possible to put the router into the mode in which all incoming data from GPRS will be routed to the computer with the defined IP address.
Default Server IP Address	Send all incoming packets to this IP addresses.

Table 33: Configuration of send all incoming packets

1. CONFIGURATION OVER WEB BROWSER

Enable the following options and enter the port number is allowed remote access to the router from PPP interface.

Item	Description
Enable remote HTTP access on port	If this item field and port number is filled in, then configuration of the router over web interface is possible (disabled in default configuration).
Enable remote HTTPS access on port	If this item field and port number is filled in, then configuration of the router over web interface is possible (disabled in default configuration).
Enable remote FTP access on port	Choice this item and port number makes it possible to access over FTP (disabled in default configuration).
Enable remote SSH access on port	Choice this item and port number makes it possible to access over SSH (disabled in default configuration).
Enable remote Telnet access on port	Choice this item and port number makes it possible to access over Telnet (disabled in default configuration).
Enable remote SNMP access on port	Choice this item and port number makes it possible to access to SNMP agent.
Masquerade outgoing packets	Choice Masquerade (alternative name for the NAT system) item option turns the system address translation NAT.

Table 34: Remote access configuration

Example of the configuration with one connection equipment on the router:

☒ Masquerade outgoing packets

Figure 33: Example NAT configuration 2

In this configuration equipment wired behind the router defines the address *Server IP Address*. The router replies, while PING on address of SIM card. Access on web interface of the equipment behind the router is possible by the help of Port Forwarding, when behind IP address of SIM is indicating public port of equipment on which we want to come up. At demand on port 80 it is surveyed singles outer ports (Public port), there this port isn't defined, therefore at check selection Enable remote http access it automatically opens the web interface router. If this choice isn't selected and is selected volition Send all remaining incoming packets to the default server fulfill oneself connection on induction IP address. If it is not selected selection *Send all remaining incoming packets to default server* and *Default server IP address* then connection requests a failure.

1.19 OpenVPN tunnel configuration

OpenVPN tunnel configuration can be called up by option *OpenVPN* item in the menu. OpenVPN tunnel allows protected connection of two networks LAN to the one which looks like one homogenous. In the *OpenVPN Tunnels Configuration* window are two rows, each row for one configured OpenVPN tunnel.

Item	Description
Create	Enables the individual tunnels
Description	Displays a name of the tunnel specified in the configuration form
Edit	Configuration of OpenVPN tunnel

Table 35: Overview OpenVPN tunnels

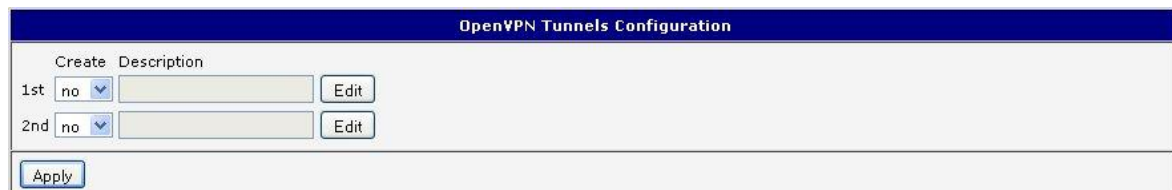

Figure 34: OpenVPN tunnels configuration

Item	Description
Description	Description (or name) of tunnel
Protocol	Communication protocol: <ul style="list-style-type: none"> • UDP – OpenVPN will communicate using UDP • TCP server – OpenVPN will communicate using TCP in server mode • TCP client – OpenVPN will communicate using TCP in client mode

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

Item	Description
UDP/TCP port	Port of the relevant protocol (UDP or TCP)
Remote IP Address	IP address of opposite tunnel side (domain name can be used)
Remote Subnet	IP address of a network behind opposite tunnel side
Remote Subnet Mask	Subnet mask of a network behind opposite tunnel side
Redirect Gateway	Allows to redirect all traffic on Ethernet
Local Interface IP Address	Defines the IP address of a local interface
Remote Interface IP Address	Defines the IP address of the interface of opposite tunnel side
Ping Interval	Defines the time interval after which sends a message to opposite side of tunnel for checking the existence of the tunnel.
Ping Timeout	Defines the time interval during which the router waits for a message sent by the opposite side. For proper verification of OpenVPN tunnel, <i>Ping Timeout</i> must be greater than <i>Ping Interval</i> .
Renegotiate Interval	Sets renegotiate period (reauthorization) of the OpenVPN tunnel. This parameter can be set only when <i>Authenticate Mode</i> is set to <i>username/password</i> or <i>X.509 certificate</i> . After this time period, router changes the tunnel encryption to ensure the continues safety of the tunnel.
Max Fragment Size	Defines the maximum size of a sent packet
Compression	Sent data can be compressed: <ul style="list-style-type: none"> • none – no compression is used • LZO – a lossless compression is used (must be set on both sides of the tunnel!)
NAT Rules	Applies NAT rules to the OpenVPN tunnel: <ul style="list-style-type: none"> • not applied – NAT rules are not applied to the OpenVPN tunnel • applied – NAT rules are applied to the OpenVPN tunnel

Figure 35: OpenVPN tunnel configuration

1. CONFIGURATION OVER WEB BROWSER

Example of the OpenVPN tunnel configuration:

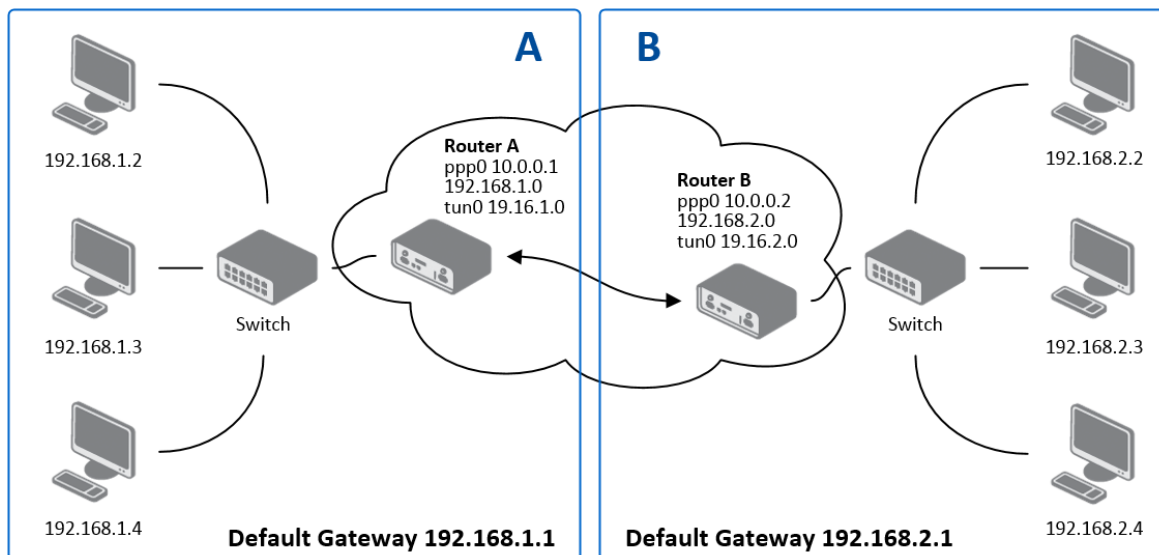

Figure 36: Topology of example OpenVPN configuration

OpenVPN tunnel configuration:

Configuration	A	B
Protocol	UDP	UDP
UDP Port	1194	1194
Remote IP Address	10.0.0.2	10.0.0.1
Remote Subnet	192.168.2.0	192.168.1.0
Remote Subnet Mask	255.255.255.0	255.255.255.0
Local Interface IP Address	19.16.1.0	19.16.2.0
Remote Interface IP Address	19.16.2.0	19.18.1.0
Compression	LZO	LZO
Authenticate mode	none	none

Table 37: Example OpenVPN configuration

Examples of different options for configuration and authentication of OpenVPN can be found in the configuration manual OpenVPN tunnel.

1.20 IPsec tunnel configuration

IPsec tunnel configuration can be called up by option *IPsec* item in the menu. IPsec tunnel allows protected (encrypted) connection of two networks LAN to the one which looks like one homogenous. In the *IPsec Tunnels Configuration* window are four rows, each row for one configured one IPsec tunnel.

Item	Description
Create	This item enables the individual tunnels.
Description	This item displays the name of the tunnel specified in the configuration of the tunnel.
Edit	Configuration IPsec tunnel.

Table 38: Overview IPsec tunnels

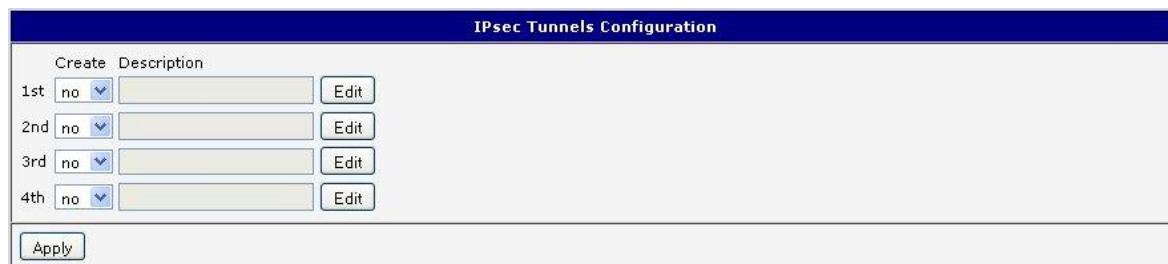

Figure 37: IPsec tunnels configuration

Item	Description
Description	Description of tunnel.
Remote IP Address	IP address of opposite side tunnel. Can be used domain main.
Remote ID	Identification of opposite side tunnel. Parameters ID contain two parts: hostname and domain-name.
Remote Subnet	Address nets behind off – side tunnel
Remote Subnet Mask	Subnet mask behind off – side tunnel
Local ID	Identification of local side. Parameters ID contain two parts: host-name and domain-name.
Local Subnet	Local subnet address
Local subnet mask	Local subnet mask
Encapsulation Mode	IPsec mode – you can choose tunnel or transport
NAT traversal	If address translation between two end points of the IPsec tunnel is used, it needs to allow NAT Traversal

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

Item	Description
IKE Mode	Defines mode for establishing connection (<i>main</i> or <i>aggressive</i>). If the <i>aggressive</i> mode is selected, establishing of IPsec tunnel will be faster, but encryption will set permanently on 3DES-MD5.
IKE Algorithm	Way of algorithm selection: <ul style="list-style-type: none"> • auto – encryption and hash alg. are selected automatically • manual – encryption and hash alg. are defined by the user
IKE Encryption	Encryption algorithm – 3DES, AES128, AES192, AES256
IKE Hash	Hash algorithm – MD5 or SHA1
IKE DH Group	Diffie-Hellman groups determine the strength of the key used in the key exchange process. Higher group numbers are more secure, but require additional time to compute the key. Group with higher number provides more security, but requires more processing time.
ESP Algorithm	Way of algorithm selection: <ul style="list-style-type: none"> • auto – encryption and hash alg. are selected automatically • manual – encryption and hash alg. are defined by the user
ESP Encryption	Encryption algorithm – DES, 3DES, AES128, AES192, AES256
ESP Hash	Hash algorithm – MD5 or SHA1
PFS	Ensures that derived session keys are not compromised if one of the private keys is compromised in the future
PFS DH Group	Diffie-Hellman group number (see <i>IKE DH Group</i>)
Key Lifetime	Lifetime key data part of tunnel. The minimum value of this parameter is 60s. The maximum value is 86400 s.
IKE Lifetime	Lifetime key service part of tunnel. The minimum value of this parameter is 60s. The maximum value is 86400 s.
Rekey Margin	Specifies how long before connection expiry should attempt to negotiate a replacement begin. The maximum value must be less than half the parameters IKE and Key Lifetime.
Rekey Fuzz	Specifies the maximum percentage by which should be randomly increased to randomize re-keying intervals
DPD Delay	Defines time after which is made IPsec tunnel verification
DPD Timeout	By parameter DPD Timeout is set timeout of the answer

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

Item	Description
Authenticate Mode	By this parameter can be set authentication: <ul style="list-style-type: none"> • Pre-shared key – shared key for both off-side tunnel • X.509 Certificate – allows X.509 certification in multiclient mode
Pre-shared Key	Sharable key for both parties tunnel.
CA Certificate	This certificate is necessary to insert Authentication mode x.509.
Remote Certificate	This certificate is necessary to insert Authentication mode x.509.
Local Certificate	This certificate is necessary to insert Authentication mode x.509.
Local Private Key	This private key is necessary to insert Authentication mode x.509.
Local Passphrase	This Local Passphrase is necessary to insert Authentication mode x.509.
Extra Options	Use this parameter to define additional parameters of the IPsec tunnel, for example secure parameters etc.

Table 39: IPsec tunnels configuration

 The certificates and private keys have to be in PEM format. As certificate it is possible to use only certificate which has start and stop tag certificate.

 Random time, after which it will re-exchange of new keys are defined:

*Lifetime - (Rekey margin + random value in range (from 0 to Rekey margin * Rekey Fuzz/100))*

By default, the repeated exchange of keys held in the time range:

- Minimal time: 1h - (9m + 9m) = 42m
- Maximal time: 1h - (9m + 0m) = 51m

When setting the times for key exchange is recommended to leave the default setting in which tunnel has guaranteed security. When set higher time, tunnel has smaller operating costs and smaller the safety. Conversely, reducing the time, tunnel has higher operating costs and higher safety of the tunnel.

The changes in settings will apply after pressing the *Apply* button.

1.22 L2TP tunnel configuration

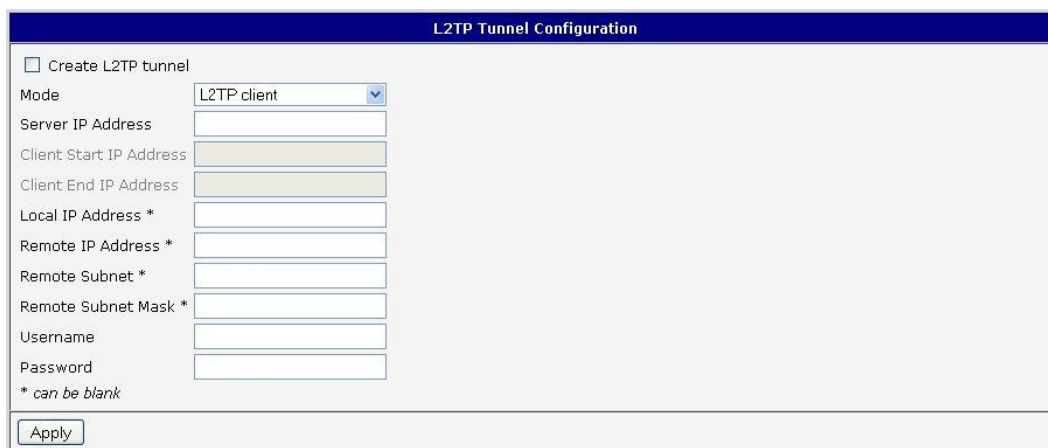

L2TP is an unencrypted protocol.

To enter the L2TP tunnels configuration, select the L2TP menu item. L2TP tunnel allows protected connection by password of two networks LAN to the one which it looks like one homogenous. The tunnels are active after selecting Create L2TP tunnel.

Item	Description
Mode	L2TP tunnel mode on the router side: <ul style="list-style-type: none"> • L2TP server – in the case of a server must be defined IP address range offered by the server • L2TP client – in case of client must be defined the IP address of the server
Server IP Address	IP address of server
Client Start IP Address	Start IP address in range, which is offered by server to clients
Client End IP Address	End IP address in range, which is offered by server to clients
Local IP Address	IP address of the local side of the tunnel
Remote IP Address	IP address of the remote side of the tunnel
Remote Subnet	Address of the network behind the remote side of the tunnel
Remote Subnet Mask	The mask of the network behind the remote side of the tunnel
Username	Username for login to L2TP tunnel
Password	Password for login to L2TP tunnel

Table 44: L2TP tunnel configuration

The changes in settings will apply after pressing the *Apply* button.

The screenshot shows the 'L2TP Tunnel Configuration' web page. At the top, there is a checkbox labeled 'Create L2TP tunnel'. Below it, the 'Mode' is set to 'L2TP client' in a dropdown menu. The form includes input fields for 'Server IP Address', 'Client Start IP Address', 'Client End IP Address', 'Local IP Address *', 'Remote IP Address *', 'Remote Subnet *', 'Remote Subnet Mask *', 'Username', and 'Password'. A note at the bottom left states '* can be blank'. An 'Apply' button is located at the bottom right of the form.

Figure 43: L2TP tunnel configuration

1. CONFIGURATION OVER WEB BROWSER

Client Start IP Address	192.168.1.2	—
Client End IP Address	192.168.1.254	—
Local IP Address	192.168.1.1	—
Remote IP Address	—	—
Remote Subnet	192.168.2.0	192.168.1.0
Remote Subnet Mask	255.255.255.0	255.255.255.0
Username	username	username
Password	password	password

Table 45: Example L2TP tunnel configuration

1.23 PPTP tunnel configuration

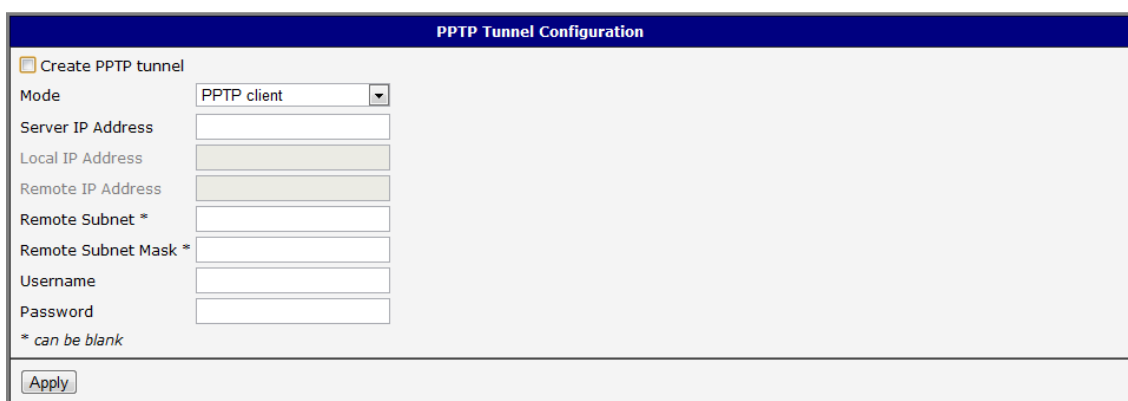

PPTP is an unencrypted protocol.

To enter the PPTP tunnels configuration, select the *PPTP* menu item. PPTP tunnel allows protected connection by password of two networks LAN to the one which it looks like one homogenous. It is a similar method of VPN execution as L2TP. The tunnels are active after selecting *Create PPTP tunnel*.

Item	Description
Mode	PPTP tunnel mode on the router side: <ul style="list-style-type: none"> • PPTP server – in the case of a server must be defined IP address range offered by the server • PPTP client – in case of client must be defined the IP address of the server
Server IP Address	IP address of server
Local IP Address	IP address of the local side of the tunnel
Remote IP Address	IP address of the remote side of the tunnel
Remote Subnet	Address of the network behind the remote side of the tunnel
Remote Subnet Mask	The mask of the network behind the remote side of the tunnel
Username	Username for login to PPTP tunnel
Password	Password for login to PPTP tunnel

Table 46: PPTP tunnel configuration

The changes in settings will apply after pressing the *Apply* button.

The screenshot shows a web browser window titled "PPTP Tunnel Configuration". At the top, there is a checkbox labeled "Create PPTP tunnel". Below this, the "Mode" is set to "PPTP client" in a dropdown menu. There are input fields for "Server IP Address", "Local IP Address", "Remote IP Address", "Remote Subnet *", "Remote Subnet Mask *", "Username", and "Password". A note at the bottom left states "* can be blank". An "Apply" button is located at the bottom right of the form.

Figure 45: PPTP tunnel configuration

Since firmware 3.0.9 is added support for PPTP passthrough, which means that it is possible to create a tunnel through router.

1. CONFIGURATION OVER WEB BROWSER

Example of the PPTP Tunnel configuration:

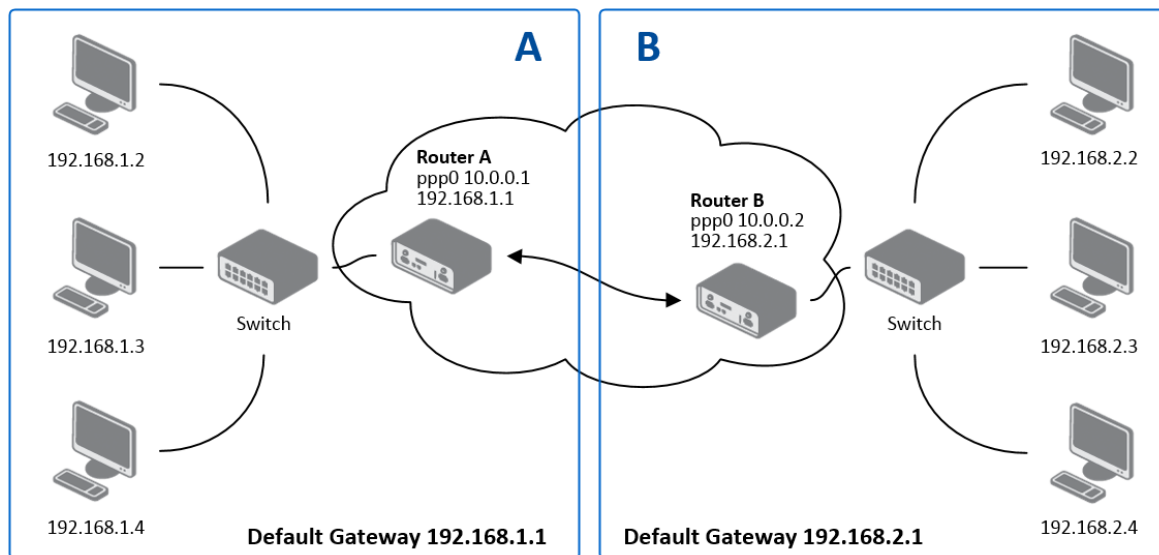

Figure 46: Topology of example PPTP tunnel configuration

Configuration of the PPTP tunnel:

Configuration	A	B
Mode	PPTP Server	PPTP Client

Local IP Address	192.168.1.1	—
Remote IP Address	—	—
Remote Subnet	192.168.2.0	192.168.1.0
Remote Subnet Mask	255.255.255.0	255.255.255.0
Username	username	username
Password	password	password

Table 47: Example PPTP tunnel configuration

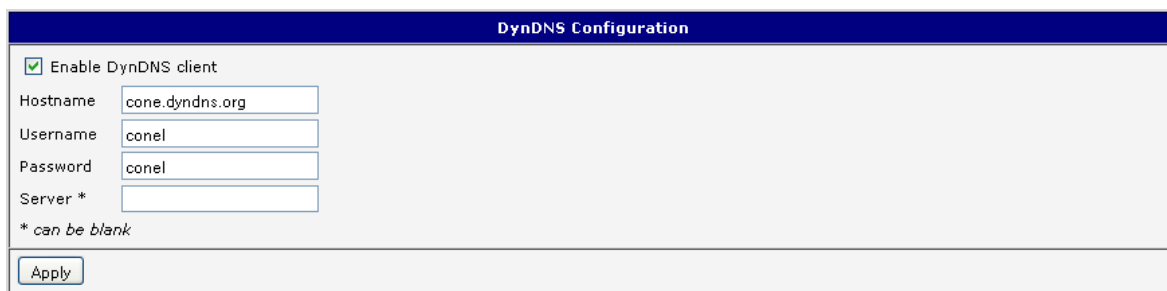

1.24 DynDNS client configuration

DynDNS client Configuration can be called up by option *DynDNS* item in the menu. In the window can be defined a third order domain registered on server www.dyndns.org.

Item	Description
Hostname	Third order domain registered on server www.dyndns.org
Username	Username for login to DynDNS server
Password	Password for login to DynDNS server
Server	If you want to use another DynDNS service than www.dyndns.org , then enter the update server service to this item. If this item is left blank, it uses the default server members.dyndns.org .

Table 48: DynDNS configuration

Example of the DynDNS client configuration with domain conel.dyndns.org:

The screenshot shows a web browser window titled "DynDNS Configuration". It contains a checkbox labeled "Enable DynDNS client" which is checked. Below this are four input fields: "Hostname" with the value "conel.dyndns.org", "Username" with the value "conel", "Password" with the value "conel", and "Server *" which is empty. A note below the "Server *" field states "* can be blank". At the bottom of the form is an "Apply" button.

Figure 47: Example of DynDNS configuration

1.25 NTP client configuration

NTP client Configuration can be called up by option *NTP* item in the menu. NTP (Network Time Protocol) allows set the exact time to the router from the servers, which provide the exact time on the network.

By parameter *Enable local NTP service* router is set to a mode in which it operates as an NTP server for other devices in the LAN behind the router.

By parameter *Enable local NTP service* it is possible to set the router in mode, that it can serve as NTP server for other devices.

Item	Description
Primary NTP Server Address	IP or domain address primary NTP server.
Secondary NTP Server Address	IP or domain address secondary NTP server.
Timezone	By this parameter it is possible to set the time zone of the router
Daylight Saving Time	By this parameter is possible to define time shift: <ul style="list-style-type: none"> • No – time shift is disabled • Yes – time shift is allowed

Table 49: NTP configuration

Example of the NTP conf. with set primary (ntp.cesnet.cz) and secondary (tik.cesnet.cz) NTP server and with daylight saving time:

NTP Configuration

☐ Enable local NTP service

☒ Synchronize clock with NTP server

Primary NTP Server

Secondary NTP Server

Timezone

Daylight Saving Time

Figure 48: Example of NTP configuration

1.26 SNMP configuration

To enter the *SNMP configuration* it is possible with SNMP agent v1/v2 or v3 configuration which sends information about the router, eventually about the status of the expansion port CNT or MBUS.

SNMP (Simple Network Management Protocol) provides status information about network elements such as routers or end computers.

Item	Description
Name	Designation of the router
Location	Location of the router
Contact	Person who manages the router together with information how to contact this person

Table 50: SNMP agent configuration

Enabling SNMPv1/v2 is performed using the *Enable SNMPv1/v2 access* item. It is also necessary to define a password for access to the SNMP agent (*Community*). Standardly is used *public* that is predefined.

The *Enable SNMPv3 access* item allows you to enable SNMPv3. Then you must define the following parameters:

Item	Description
Username	User name
Authentication	Encryption algorithm on the Authentication Protocol that is used to ensure the identity of users.
Authentication Password	Password used to generate the key used for authentication.
Privacy	Encryption algorithm on the Privacy Protocol that is used to ensure confidentiality of data.
Privacy Password	Password for encryption on the Privacy Protocol.

Table 51: SNMPv3 configuration

In addition, you can continue with this configuration:

- By choosing *Enable I/O extension* it is possible to monitor binary inputs I/O on the router.
- By choosing *Enable XC-CNT extension* it is possible to monitor the expansion port CNT inputs and outputs status.
- By choosing *Enable M-BUS extension* and enter the *Baudrate*, *Parity* and *Stop Bits* it is possible to monitor the meter status connected to the expansion port MBUS status.

1. CONFIGURATION OVER WEB BROWSER

Item	Description
Baudrate	Communication speed.
Parity	Control parity bit: <ul style="list-style-type: none"> • none – data will be sent without parity • even – data will be sent with even parity • odd – data will be sent with odd parity
Stop Bits	Number of stop bit.

Table 52: SNMP configuration (MBUS extension)

 Parameters *Enable XC-CNT extension* and *Enable M-BUS extension* can not be checked together.

By choosing *Enable reporting to supervisory system* and enter the *IP Address* and *Period* it is possible to send statistical information to the monitoring system R-SeeNet.

Item	Description
IP Address	IP address
Period	Period of sending statistical information (in minutes)

Table 53: SNMP configuration (R-SeeNet)

Every monitor value is uniquely identified by the help of number identifier *OID* – *Object Identifier*. For binary input and output the following range of OID is used:

OID	Description
.1.3.6.1.4.1.30140.2.3.1.0	Binary input BIN0 (values 0,1)
.1.3.6.1.4.1.30140.2.3.2.0	Binary output OUT0 (values 0,1)

Table 54: Object identifier for binary input and output

For the expansion port CNT the following range of OID is used:

OID	Description
.1.3.6.1.4.1.30140.2.1.1.0	Analogy input AN1 (range 0-4095)
.1.3.6.1.4.1.30140.2.1.2.0	Analogy input AN2 (range 0-4095)
.1.3.6.1.4.1.30140.2.1.3.0	Counter input CNT1 (range 0-4294967295)
.1.3.6.1.4.1.30140.2.1.4.0	Counter input CNT2 (range 0-4294967295)
.1.3.6.1.4.1.30140.2.1.5.0	Binary input BIN1 (values 0,1)

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

OID	Description
.1.3.6.1.4.1.30140.2.1.6.0	Binary input BIN2 (values 0,1)
.1.3.6.1.4.1.30140.2.1.7.0	Binary input BIN3 (values 0,1)
.1.3.6.1.4.1.30140.2.1.8.0	Binary input BIN4 (values 0,1)
.1.3.6.1.4.1.30140.2.1.9.0	Binary output OUT1 (values 0,1)

Table 55: Object identifier for CNT port

For the expansion port M-BUS the following range of OID is used:

OID	Description
.1.3.6.1.4.1.30140.2.2.<address>.1.0	IdNumber – meter number
.1.3.6.1.4.1.30140.2.2.<address>.2.0	Manufacturer
.1.3.6.1.4.1.30140.2.2.<address>.3.0	Version – specified meter version
.1.3.6.1.4.1.30140.2.2.<address>.4.0	Medium – type of metered medium
.1.3.6.1.4.1.30140.2.2.<address>.5.0	Status – errors report
.1.3.6.1.4.1.30140.2.2.<address>.6.0	0. VIF – value information field
.1.3.6.1.4.1.30140.2.2.<address>.7.0	0. measured value
.1.3.6.1.4.1.30140.2.2.<address>.8.0	1. VIF – value information field
.1.3.6.1.4.1.30140.2.2.<address>.9.0	1. measured value
.1.3.6.1.4.1.30140.2.2.<address>.10.0	2. VIF – value information field
.1.3.6.1.4.1.30140.2.2.<address>.11.0	2. measured value
.1.3.6.1.4.1.30140.2.2.<address>.12.0	3. VIF – value information field
.1.3.6.1.4.1.30140.2.2.<address>.13.0	3. measured value
⋮	⋮
.1.3.6.1.4.1.30140.2.2.<address>.100.0	47. VIF – value information field
.1.3.6.1.4.1.30140.2.2.<address>.101.0	47. measured value

Table 56: Object identifier for M-BUS port

The meter address can be from range 0..254 when 254 is broadcast.

Since firmware 3.0.4 all v2 routers with board RB-v2-6 and newer provide information about internal temperature of device (OID 1.3.6.1.4.1.30140.3.3) and power voltage (OID 1.3.6.1.4.1.30140.3.4).

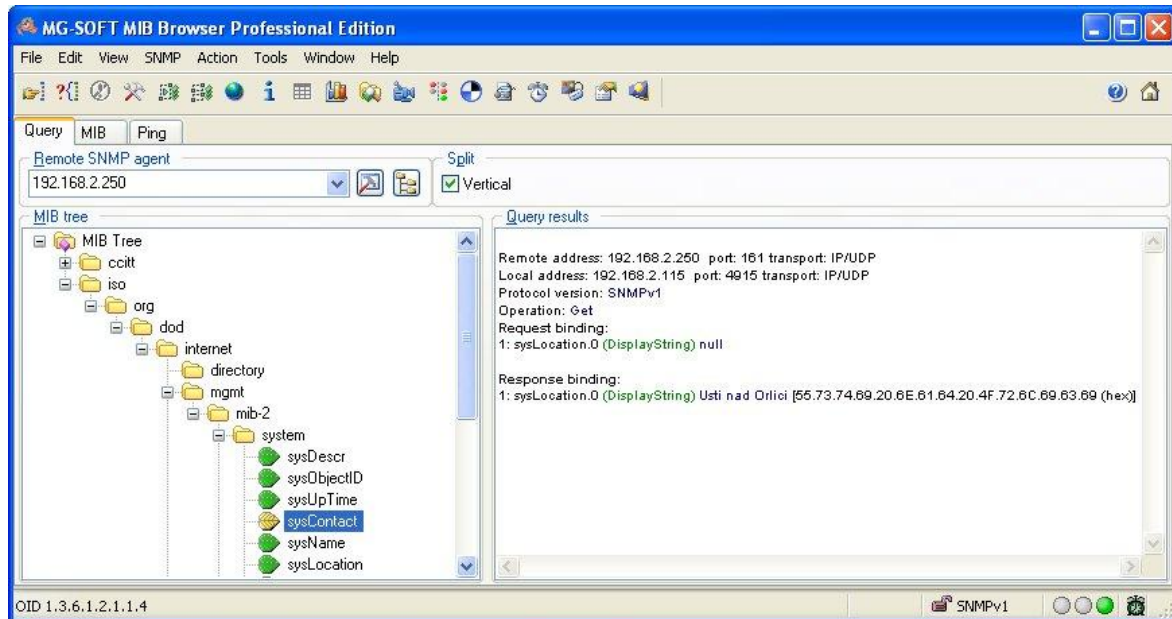

Figure 50: Example of the MIB browser

It is important to set the IP address of the SNMP agent (router) in field Remote SNMP agent. After enter the IP address is in a MIB tree part is possible show object identifier.

The path to objects is:

iso → org → dod → internet → private → enterprises → conel → protocols

The path to information about router is:

iso → org → dod → internet → mgmt → mib-2 → system

1.27 SMTP configuration

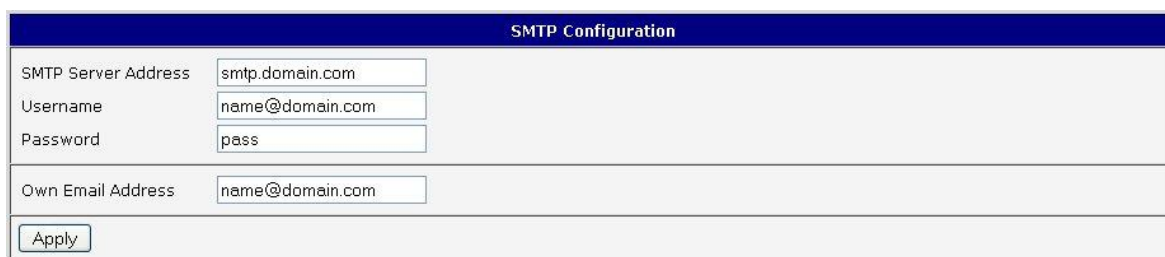

To enter the *SMTP* it is possible configure SMTP (Simple Mail Transfer Protocol) client, which is set by sending emails.

Item	Description
SMTP Server Address	IP or domain address of the mail server.
Username	Name to email account.
Password	Password to email account.
Own Email Address	Address of the sender.

Table 57: SMTP client configuration

 Mobile operator can block other SMTP servers, then you can use only the SMTP server of operator.

Example settings SMTP client:

The screenshot shows a web form titled "SMTP Configuration". It contains four input fields: "SMTP Server Address" with the value "smtp.domain.com", "Username" with the value "name@domain.com", "Password" with the value "pass", and "Own Email Address" with the value "name@domain.com". Below the fields is an "Apply" button.

Figure 51: SMTP configuration

E-mail can be send from the Startup script. This command is used to email with following parameters.

- -t receiver Email address
- -s subject
- -m message
- -a appendix
- -r number of attempts to send email (default set 2 attempts)

 Commands and parameters can be entered only in lowercase.

Example to send email:

```
email -t name@domain.com -s "subject" -m "message" -a c:\directory\abc.doc -r 5
```

This command sends e-mail to address *jack@google.com* with the subject "*subject*", body message "*message*" and annex "*abc.doc*" right from the directory *c:\directory* and 5 attempts to send.

1.28 SMS configuration

SMS Configuration can be called up by option *SMS* item in the menu. SMS configuration defines the options for sending SMS messages from the router at different defined events and states of the router. In the first part of window it configuration send SMS.

Item	Description
Send SMS on power up	Automatic sending of SMS messages after power up.
Send SMS on connect to mobile network	Automatic sending SMS message after connection to mobile network.
Send SMS on disconnect to mobile network	Automatic sending SMS message after disconnection to mobile network.
Send SMS when datalimit exceeded	Automatic sending SMS message after datalimit exceeded.
Send SMS when binary input on I/O port (BIN0) is active	Automatic sending SMS message after binary input on I/O port (BIN0) is active. Text of message is intended parameter BIN0.
Send SMS when binary input on expansion port (BIN1 – BIN4) is active	Automatic sending SMS message after binary input on expansion port (BIN1 – BIN4) is active. Text of message is intended parameter BIN1 – BIN4.
Add timestamp to SMS	Adds time stamp to sent SMS messages. This stamp has a fixed format YYYY-MM-DD hh:mm:ss.
Phone Number 1	Phone number for sending automat. generated SMS.
Phone Number 2	Phone number for sending automat. generated SMS.
Phone Number 3	Phone number for sending automat. generated SMS.
Unit ID	The name of the router that will be sent in an SMS.
BIN0 – SMS	SMS text messages when activate the binary input on the router.
BIN1 – SMS	SMS text messages when activate the binary input on the CNT expansion port.
BIN2 – SMS	SMS text messages when activate the binary input on the CNT expansion port.
BIN3 – SMS	SMS text messages when activate the binary input on the CNT expansion port.
BIN4 – SMS	SMS text messages when activate the binary input on the CNT expansion port.

Table 58: Send SMS configuration

1. CONFIGURATION OVER WEB BROWSER

In the second part of the window it is possible to set function *Enable remote control via SMS*. After this it is possible to establish and close connection by SMS message.

Item	Description
Phone Number 1	This control can be configured for up to three numbers. If is set <i>Enable remote control via SMS</i> , all incoming SMS are processed and deleted. In the default settings this parameter is turned on.
Phone Number 2	This control can be configured for up to three numbers. If is set <i>Enable remote control via SMS</i> , all incoming SMS are processed and deleted. In the default settings this parameter is turned on.
Phone Number 3	This control can be configured for up to three numbers. If is set <i>Enable remote control via SMS</i> , all incoming SMS are processed and deleted. In the default settings this parameter is turned on.

Table 59: Control via SMS configuration

 If no phone number is filled in, then it is possible to restart the router with the help of SMS in the form of Reboot from any phone number. While filling of one, two or three numbers it is possible to control the router with the help of an SMS sent only from these numbers. While filling of sign "*" it is possible control the router with the help of an SMS sent from every numbers.

 Control SMS message doesn't change the router configuration. If the router is switched to offline mode by the SMS message the router will be in this mode up to next restart. This behavior is the same for all control SMS messages.

It is possible to send controls SMS in the form:

SMS	Description
go online sim 1	Switch to SIM1 card
go online sim 2	Switch to SIM2 card
go online	Switch router in online mode
go offline	connection termination
set out0=0	Set output I/O connector on 0
set out0=1	Set output I/O connector on 1
set out1=0	Set output expansion port XC-CNT on 0
set out1=1	Set output expansion port XC-CNT on 1
set profile std	Set standard profile
set profile alt1	Set alternative profile 1
set profile alt2	Set alternative profile 2
set profile alt3	Set alternative profile 3

Continued on next page

Continued from previous page

SMS	Description
reboot	Router reboot
get ip	Router send answer with IP address SIM card

Table 60: Control SMS

By choosing *Enable AT-SMS protocol on expansion port 1* and *Baudrate* it is possible to send/receive an SMS on the serial Port 1.

Item	Description
Baudrate	Communication speed expansion port 1

Table 61: Send SMS on serial PORT1 configuration

By choosing *Enable AT-SMS protocol on expansion port 2* and *Baudrate* it is possible to send/receive an SMS on the serial Port 2.

Item	Description
Baudrate	Communication speed expansion port 2

Table 62: Send SMS on serial PORT2 configuration

By choosing *Enable AT-SMS protocol on TCP port* and enter the *TCP port* it is possible to send/receive an SMS on the TCP port. SMS messages are sent by the help of a standard AT commands.

Item	Description
TCP Port	TCP port on which will be allowed to send/receive SMS messages.

Table 63: Send SMS on ethernet PORT1 configuration

1.28.1 Send SMS

After establishing connection with the router via serial interface or Ethernet, it is possible to use AT commands for work with SMS messages.

The following table only lists the commands that are supported by Conel's routers. For other AT commands is always sent *OK* response. There is no support for treatment of complex AT commands, so in such a case router sends *ERROR* response.

AT Command	Description
AT+CGMI	Returns the manufacturer specific identity
AT+CGMM	Returns the manufacturer specific model identity

Continued on next page

1. CONFIGURATION OVER WEB BROWSER

Continued from previous page

AT Command	Description
AT+CGMR	Returns the manufacturer specific model revision identity
AT+CGPADDR	Displays the IP address of the ppp0 interface
AT+CGSN	Returns the product serial number
AT+CIMI	Returns the International Mobile Subscriber Identity number (IMSI)
AT+CMGD	Deletes a message from the location
AT+CMGF	Sets the presentation format of short messages
AT+CMGL	Lists messages of a certain status from a message storage area
AT+CMGR	Reads a message from a message storage area
AT+CMGS	Sends a short message from the device to entered tel. number
AT+CMGW	Writes a short message to SIM storage
AT+CMSS	Sends a message from SIM storage location value
AT+COPS?	Identifies the available mobile networks
AT+CPIN	Is used to query and enter a PIN code
AT+CPMS	Selects SMS memory storage types, to be used for short message operations
AT+CREG	Displays network registration status
AT+CSCA	Sets the short message service centre (SMSC) number
AT+CSCS	Selects the character set
AT+CSQ	Returns the signal strength of the registered network
AT+GMI	Returns the manufacturer specific identity
AT+GMM	Returns the manufacturer specific model identity
AT+GMR	Returns the manufacturer specific model revision identity
AT+GSN	Returns the product serial number
ATE	Determines whether or not the device echoes characters
ATI	Transmits the manufacturer specific information about the device

Table 64: List of AT commands

A detailed description and examples of these AT commands can be found in the application note *AT commands*.

1. CONFIGURATION OVER WEB BROWSER

After powering up the router, at the mentioned the phone number comes SMS in this form:
Router (Unit ID) has been powered up. Signal strength –xx dBm.

After connect to mobile network, at the mentioned phone number comes SMS in this form:
Router (Unit ID) has established connection to mobile network. IP address xxx.xxx.xxx.xxx

After disconnect to mobile network, at the mentioned phone number comes SMS in this form:
Router (Unit ID) has lost connection to mobile network. IP address xxx.xxx.xxx.xxx

Configuration of sending this SMS is following:

SMS Configuration

* can be blank	
<input type="button" value="Apply"/>	

Figure 55: Example of SMS configuration 4

1.29 Expansion port configuration

Configuring of the expansion ports PORT1 and PORT2 can cause selecting *Expansion Port 1* or *Expansion Port 2*.

Item	Description
Baudrate	Applied communication speed.
Data Bits	Number of data bits.
Parity	Control parity bit <ul style="list-style-type: none"> • none – will be sent without parity • even – will be sent with even parity • odd – will be sent with odd parity
Stop Bits	Number of stop bit.
Split Timeout	Time to rupture reports. If you receive will identify the gap between two characters, which is longer than the parameter value in milliseconds. Then all of the received data compiled and sent the message.
Protocol	Protocol: <ul style="list-style-type: none"> • TCP – communication using a linked protocol TCP • UDP – communication using a unlinked protocol UDP
Mode	Mode of connection: <ul style="list-style-type: none"> • TCP server – router will listen to incoming requests about TCP connection • TCP client – router will connect to a TCP server on the specified IP address and TCP port
Server Address	In mode TCP client it is necessary to enter the Server address and final TCP port.
TCP Port	In both modes of connection is necessary to specify the TCP port on which the router will communicate TCP connections.

Table 65: Expansion PORT configuration 1

After check *Check TCP connection*, it activates established of TCP connection.

Item	Description
Keepalive Time	Time, after which it will carry out verification of the connection
Keepalive Interval	Waiting time on answer
Keepalive Probes	Number of tests

Table 66: Expansion PORT configuration 2

1. CONFIGURATION OVER WEB BROWSER

When you select items *Use CD as indicator of the TCP connection* is activated function indication TCP connection using signal CD (DTR on the router).

CD	Description
Active	TCP connection is on
Nonactive	TCP connection is off

Table 67: CD signal description

When you select items *Use DTR as control of TCP connection* is activated function control TCP connection using signal DTR (CD on the router).

DTR	Description server	Description client
Active	The router allows establishing a TCP connection	Router starts TCP connection
Nonactive	The router does not permit establishing a TCP connection	Router stops TCP connection

Table 68: DTR signal description

The changes in settings will apply after pressing the *Apply* button.

Figure 56: Expansion port configuration

1. CONFIGURATION OVER WEB BROWSER

Example of external port configuration:

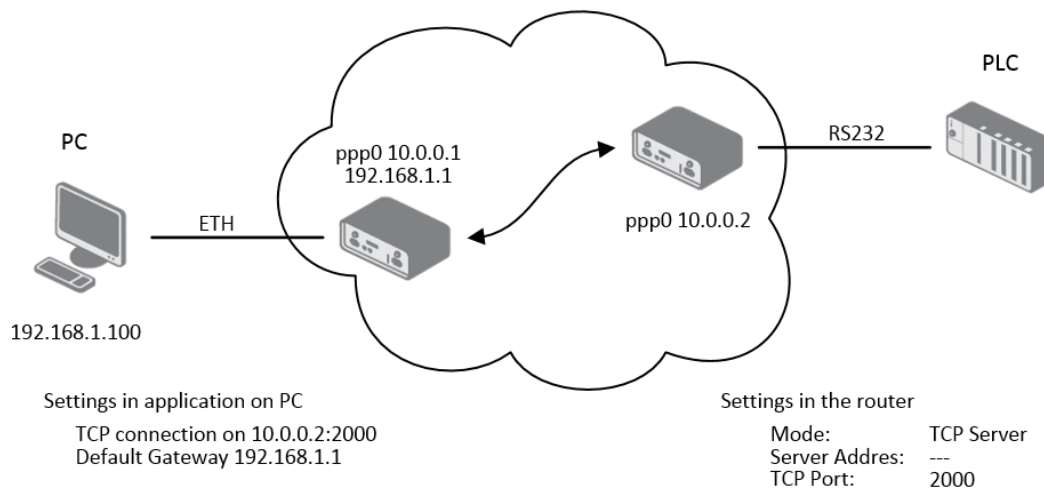

Figure 57: Example of expansion port configuration 1

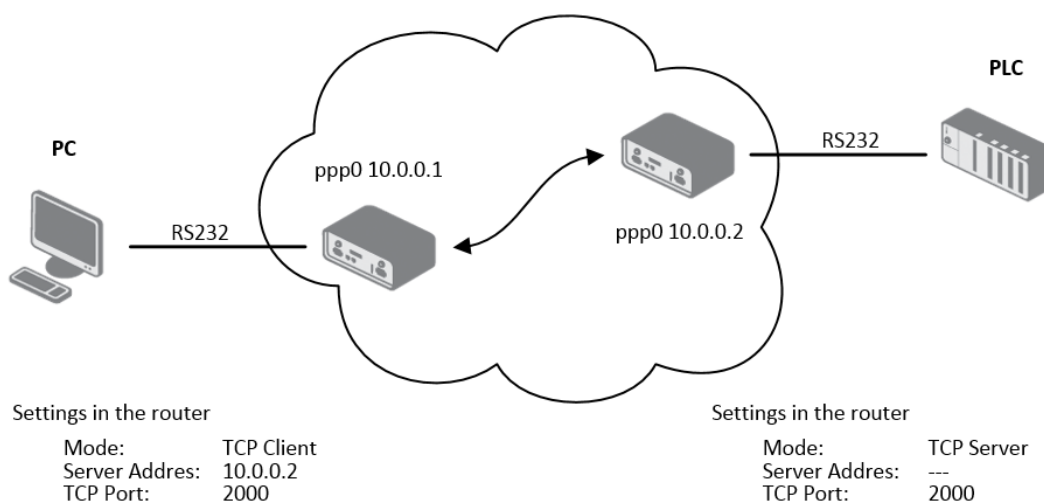

Figure 58: Example of expansion port configuration 2

Since firmware 3.0.9 all v2 routers provide a program called *getty* which allows user to connect to the router via the serial line (router must be fitted with an expansion port RS232!). *Getty* displays the prompt and after entering the username passes it on *login* program, which asks for a password, verifies it and runs the shell. After logging in, it is possible to manage the system as well as a user is connected via telnet.

1.30 USB port configuration

The USB port configuration can be called up by airbrush option *USB Port* in menu. Configuration can be done, if we have USB/RS232 converter.

Item	Description
Baudrate	Applied communication speed.
Data Bits	Number of data bits.
Parity	Control parity bit: <ul style="list-style-type: none"> • none – will be sent without parity • even – will be sent with even parity • odd – will be sent with odd parity
Stop Bits	Number of stop bit.
Split Timeout	Time to rupture reports. If you receive will identify the gap between two characters, which is longer than the parameter value in milliseconds. Then all of the received data compiled and sent the message.
Protocol	Communication protocol: <ul style="list-style-type: none"> • TCP – communication using a linked protocol TCP • UDP – communication using a unlinked protocol UDP
Mode	Mode of connection: <ul style="list-style-type: none"> • TCP server – router will listen to incoming requests about TCP connection • TCP client – router will connect to a TCP server on the specified IP address and TCP port
Server Address	In mode TCP client it is necessary to enter the Server address and final TCP port.
TCP Port	In both modes of connection is necessary to specify the TCP port on which the router will communicate TCP connections.

Table 69: USB port configuration 1

After check *Check TCP connection*, it activates verification of established TCP connection.

1. CONFIGURATION OVER WEB BROWSER

Item	Description
Keepalive Time	Time, after which it will carry out verification of the connection
Keepalive Interval	Waiting time on answer
Keepalive Probes	Number of tests

Table 70: USB PORT configuration 2

When you select items *Use CD as indicator of the TCP connection* is activated function indication TCP connection using signal CD (DTR on the router).

CD	Description
Active	TCP connection is on
Nonactive	TCP connection is off

Table 71: CD signal description

When you select items *Use DTR as control of TCP connection* is activated function control TCP connection using signal DTR (CD on the router).

DTR	Description server	Description client
Active	The router allows establishing a TCP connection	Router starts TCP connection
Nonactive	The router does not permit establishing a TCP connection	Router stops TCP connection

Table 72: DTR signal description

Supported USB/RS232 converters:

- FTDI
- Prolific PL2303
- Silicon Laboratories CP210×(supported from firmware version 3.0.1)

The changes in settings will apply after pressing the *Apply* button

1. CONFIGURATION OVER WEB BROWSER

USB Port Configuration	
<input type="checkbox"/> Enable USB serial converter access over TCP/UDP	
Baudrate	9600
Data Bits	8

<input type="button" value="Apply"/>	

Figure 59: USB configuration

Example of USB port configuration:

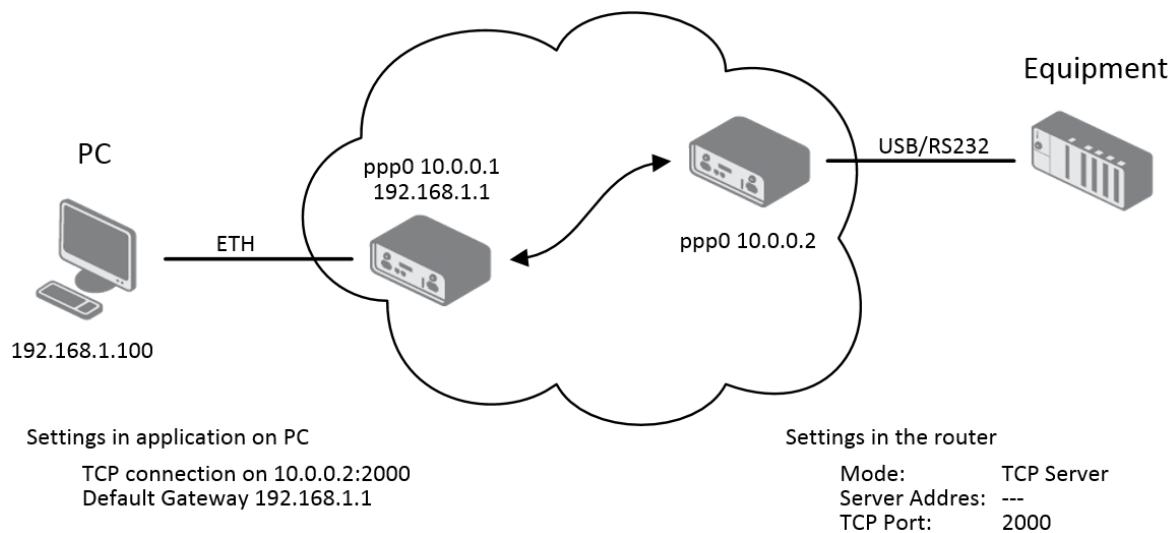

Figure 60: Example of USB port configuration 1

1. CONFIGURATION OVER WEB BROWSER

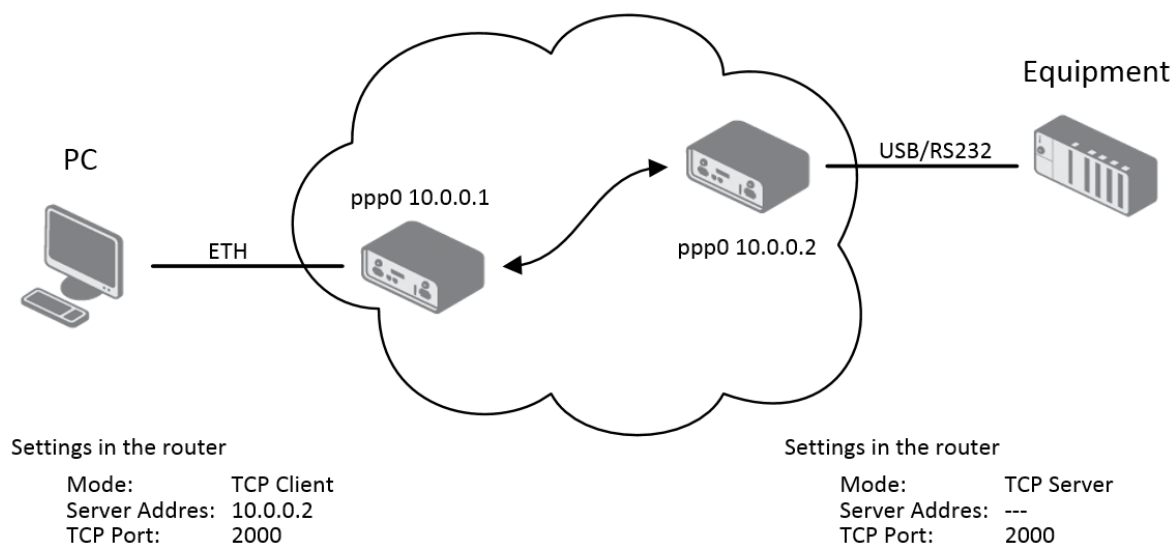

Figure 61: Example of USB port configuration 2

1.31 Startup script

In the window *Startup Script* it is possible to create own scripts which will be executed after all initial scripts.

The changes in settings will apply after pressing the *Apply* button.

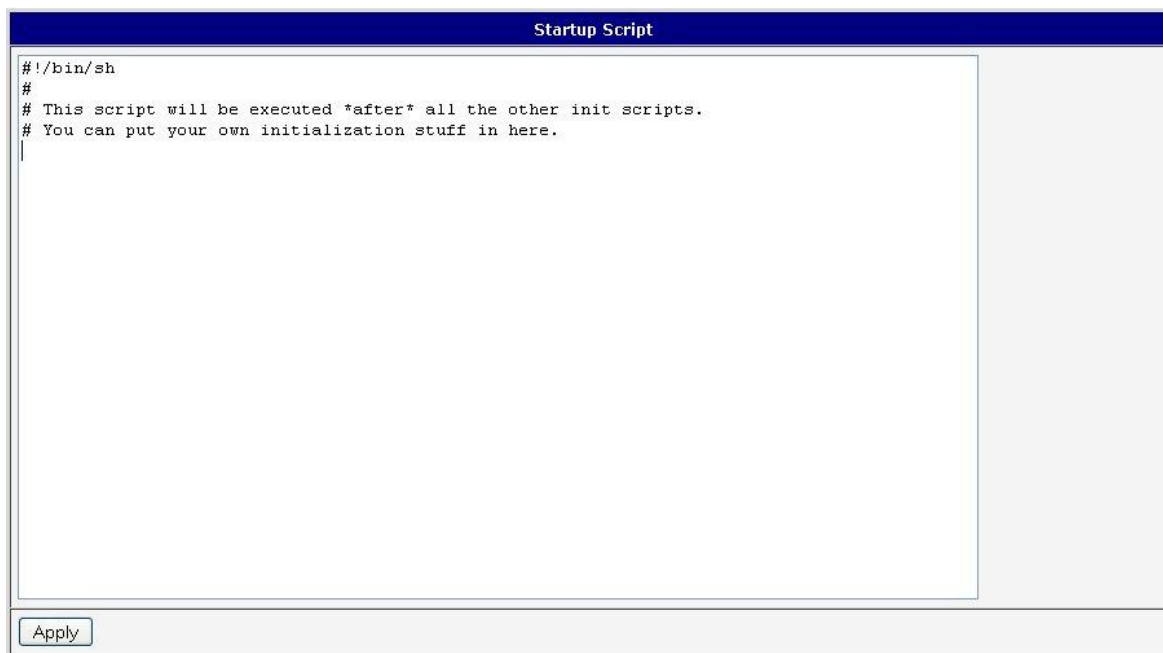

Figure 62: Startup script

 Change take effect after shut down and witch on router by the help of button Reboot in web administration or by SMS message.

Example of Startup script: When start the router, stop syslogd program and start syslogd with remote logging on address 192.168.2.115 and limited to 100 entries listing.

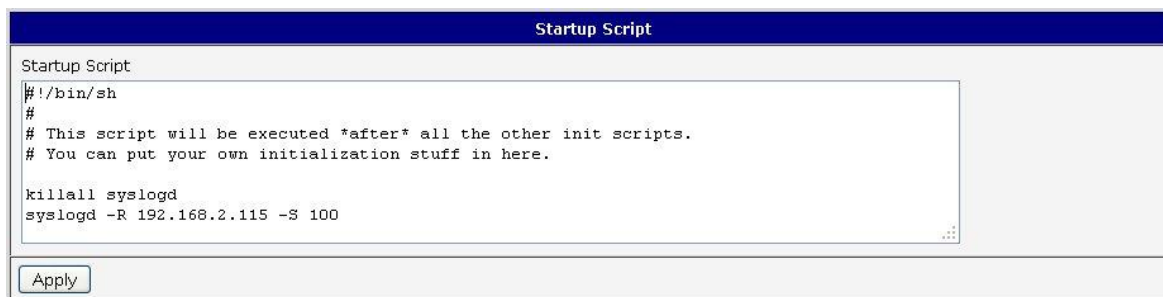

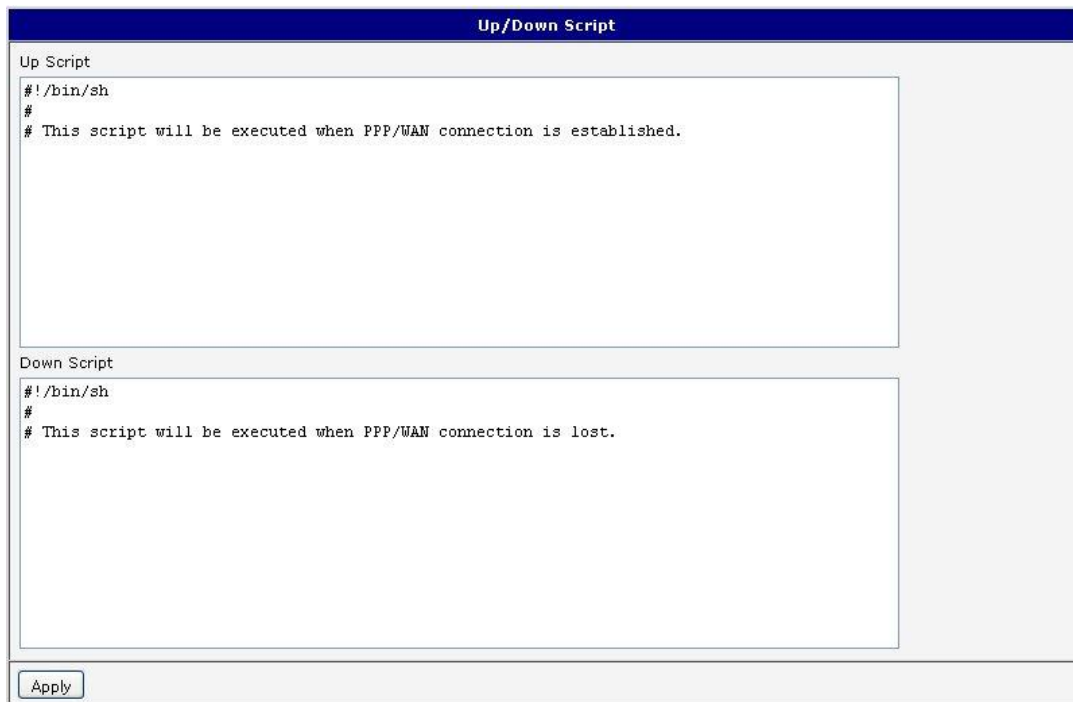

Figure 63: Example of Startup script

1.32 Up/Down script

In the window *Up/Down Script* it is possible to create own scripts. In the item *Up script* is defined scripts, which begins after establishing a PPP/WAN connection. In the item *Down Script* is defines script, which begins after lost a PPP/WAN connection.

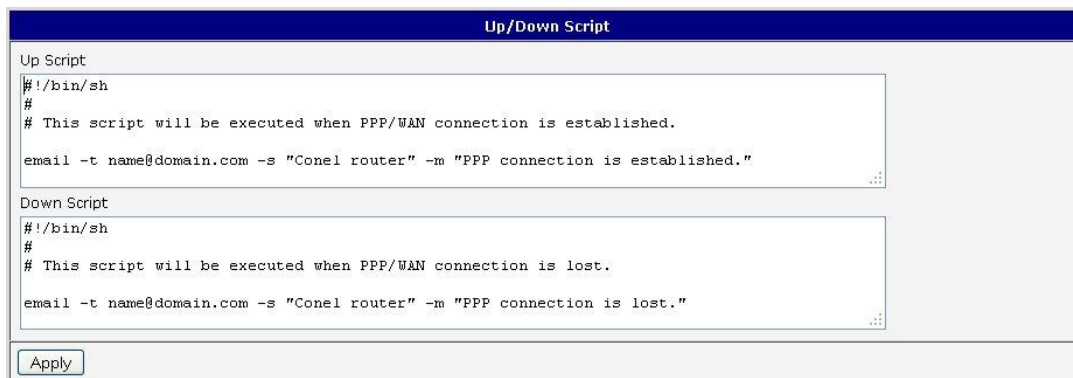

The changes in settings will apply after pressing the *Apply* button.

The screenshot shows a web browser window titled "Up/Down Script". It contains two text areas for scripts. The "Up Script" area has the following content: `#!/bin/sh`, `#`, and `# This script will be executed when PPP/WAN connection is established.`. The "Down Script" area has the following content: `#!/bin/sh`, `#`, and `# This script will be executed when PPP/WAN connection is lost.`. At the bottom of the window is an "Apply" button.

Figure 64: Up/Down script

Example of UP/Down script: After establishing or lost a connection, the router sends an email with information about establishing or loss a connection.

The screenshot shows the same "Up/Down Script" window, but with example email scripts. The "Up Script" area contains: `#!/bin/sh`, `#`, `# This script will be executed when PPP/WAN connection is established.`, and `email -t name@domain.com -s "Conel router" -m "PPP connection is established."`. The "Down Script" area contains: `#!/bin/sh`, `#`, `# This script will be executed when PPP/WAN connection is lost.`, and `email -t name@domain.com -s "Conel router" -m "PPP connection is lost."`. At the bottom is an "Apply" button.

Figure 65: Example of Up/Down script

1.33 Automatic update configuration

In the window *Automatic update* it is possible to set automatic configuration update. This choice enables that the router automatically downloads the configuration and the newest firmware from the server itself. The configuration and firmware are stores on the server. To prevent possible manipulation of the update, downloaded file (tar.gz format) is controlled. At first, format of the downloaded file is checked. Then there is controlled type of architecture and each file in the archive (tar.gz file).

By *Enable automatic update of configuration* it is possible to enable automatic configuration update and by *Enable automatic update of firmware* it is possible to enable firmware update.

Item	Description
Source	<p>In the item source can be set, where new firmware download:</p> <ul style="list-style-type: none"> • HTTP/FTP server – New firmware or configuration look at address in the Base URL item • USB flash drive – Router finds current firmware or configuration in the root directory of the connected USB device • Both – Looking for the current firmware or configuration from both sources
Base URL	By parameter Base URL it is possible to enter base part of the domain or IP address, from which the configuration file will be downloaded.
Unit ID	Name of configuration. If the Unit ID is not filled, then as the file name used the MAC address of the router. (The delimiter is a colon is used instead of a dot.)
Update Hour	Use this item to set the hour (range 1-24) in which automatic update will be performed every day. If the time is not specified, automatic update is performed five minutes after turning on the router and then every 24 hours. In the event of a different configuration at the specified URL router downloads this configuration and restarts itself.

Table 73: Automatic update configuration

 The *configuration file* name is from parameter *Base URL*, hardware MAC address of ETH0 interface and *cfg* extension. Hardware MAC address and *cfg* extension is connected automatically and it isn't needed to enter this. By parameter *Unit ID* enabled it defines the concrete configuration name which will be download to the router. When using parameter *Unit ID*, hardware MAC address in configuration name will not be used.

 The *firmware file* name is from parameter *Base URL*, type of router and bin extension. It is necessary to load two files (.bin and .ver) to the HTTP/FTP server. If there is uploaded only the .bin file and the HTTP server send wrong answer *200 OK* (instead of expected *404 Not Found*) when the device try to download the nonexistent .ver file, then there is a high risk that the router will download the .bin file over and over again.

1. CONFIGURATION OVER WEB BROWSER

The following examples find if there is a new firmware or configuration each day at 1:00 in the morning.

- Firmware: `http://router.cz/ucr11-v2.bin`
- Configuration file: `http://router.cz/temelin.cfg`

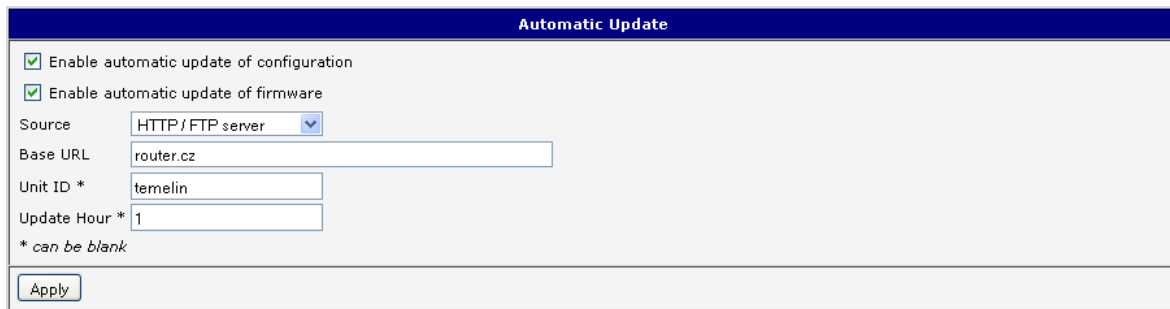

Figure 66: Example of automatic update 1

The following examples find if there is a new firmware or configuration each day at 1:00 in the morning. An example is given for the router with the MAC address 00:11:22:33:44:55.

- Firmware: `http://router.cz/ucr11-v2.bin`
- Configuration file: `http://router.cz/00.11.22.33.44.55.cfg`

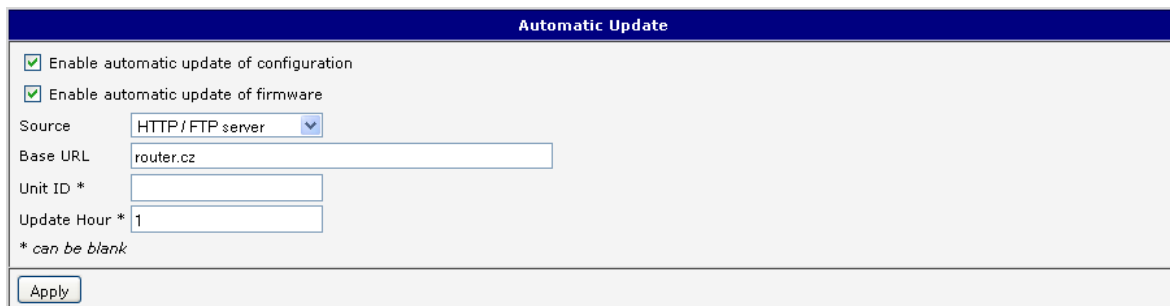

Figure 67: Example of automatic update 2

1.34 User modules

Configuration of user modules can be accessed by selecting the *User Modules* item. It is possible to add new modules, delete them or switch to their configuration. Use the *Browse* button to select the user module (compiled module has tgz extension). The module is added using the *Add* button.

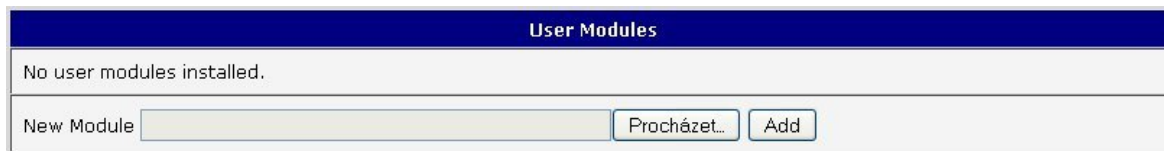

Figure 68: User modules

Added module appears in the list of modules on the same page. If the module contains index.html or index.cgi page, module name serves as a link to this page. The module can be deleted using the *Delete* button.

Updating of the module can be done in the same way like adding a new module. Module with a higher (newer) version will replace the existing module. The current module configuration is kept in same state.

Programming and compiling of modules are described in the programming guide.

Figure 69: Added user module

There are for example these user's modules:

Module name	Description
MODBUS TCP2RTU	Provides a conversion of MODBUS TCP/IP protocol to MDBUS RTU protocol, which can be operated on the serial line.
Easy VPN client	Provides secure connection of LAN network behind our router with LAN network behind CISCO router.
NMAP	Allows to do TCP and UDP scan.
Daily Reboot	Allows to perform daily reboot of the router at the specified time.
HTTP Authentication	Adds the process of authentication to a server that doesn't provide this service.
BGP, RIP, OSPF	Add support of dynamic protocols.
PIM SM	Adds support of multicast routing protocol PIM-SM.

Continued on next page

Continued from previous page

Module name	Description
WMBUS Concentrator	Allows to receive messages from WMBUS meters and saves contents of these messages to XML file.
pduSMS	Sends short messages (SMS) to specified number.
GPS	Allows v2 router to provide location and time information in all weather, anywhere on or near the Earth, where there is an unobstructed line of sight to four or more GPS satellites.
Pinger	Allows to manually or automatically verify the functionality of the connection between two network interfaces (ping).
IS-IS	Add support of IS-IS protocol.

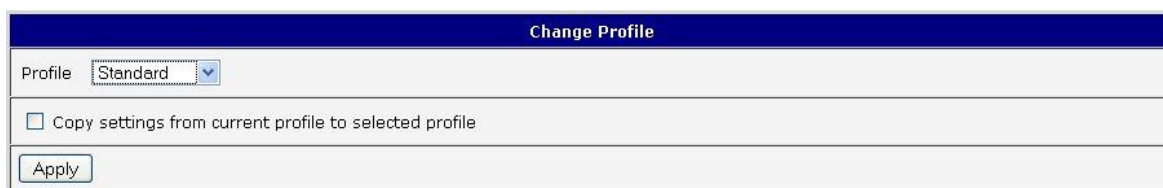

Table 74: User modules

 Attention, in the case of modules which are dependent on the version of linux kernel (these are *SmsBE* and *PoS Configuration*), it is necessary to distinguish for which kernel (firewall) are intended.

1.35 Change profile

To open the dialog box for changing profile select the *Change Profile* menu item. Profile switch is making by press the button *Apply*. Change take effect after restarting router by the help of button *Reboot* in web administration or by SMS message. It is possible select the standard profile or up to three alternative profiles. It is possible to copy actual configuration to selected configuration by selecting *Copy settings from current profile to selected profile*.

Example of usage profiles: Profiles can be used for example to switch between different modes of operation of the router (router has compiled a connection, the router has not compiled a connection and the router creates a tunnel to the service center). Change the profile can then be done using a binary input, SMS or Web interface of the router.

The dialog box titled "Change Profile" contains a "Profile" dropdown menu currently set to "Standard". Below it is a checkbox labeled "Copy settings from current profile to selected profile" which is unchecked. At the bottom is an "Apply" button.

Figure 70: Change profile

1.36 Change password

To open the dialog box for changing the access password select the *Change Password* menu item. The new password will be saved after pressing the *Apply* button.

In basic settings of the router the password is set on default form *root*. For higher security of your network we recommend changing this password.

The dialog box titled "Change Password" contains two input fields: "New Password" and "Confirm Password". Below these fields is an "Apply" button.

Figure 71: Change password

1.37 Set real time clock

Disposable setting of the router internal clock can be invoked by pressing the *Set Real Time Clock* item in the main menu of the web interface. Date and time can be set manually through the *Date* and *Time* items. Always enter data in a format that is illustrated in the figure below. The clock can be also adjusted according to the specified NTP server. Finally, it is necessary to press the *Apply* button.

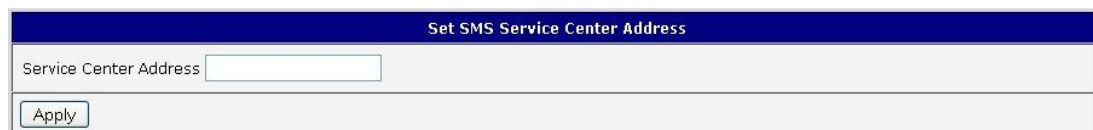

The dialog box titled "Set Real Time Clock" contains three input fields: "Date" (with example text "2013 - 07 - 08"), "Time" (with example text "12 : 50 : 17"), and "NTP Server Address". Below these fields is an "Apply" button.

Figure 72: Set real time clock

1.38 Set SMS service center address

In some cases it is needed to set the phone number of the SMS service centre because of SMS sending. This parameter can not be set when the SIM card has set phone number of the SMS service centre. The phone number can be formed without international prefix xxx xxx xxx or with international prefix for example +420 xxx xxx xxx.

The dialog box titled "Set SMS Service Center Address" contains one input field: "Service Center Address". Below this field is an "Apply" button.

Figure 73: Set SMS service center address

1.39 Unlock SIM card

Possibility to unlock SIM PIN is under *Unlock SIM Card* item. If the inserted SIM card is secured by a PIN number, enter the PIN to field *SIM PIN* and push-button *Apply*.

SIM card is blocked after three failed attempts to enter the PIN code.

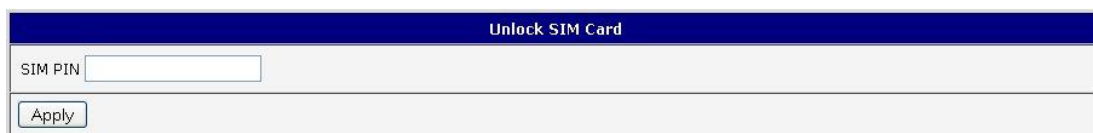

Figure 74: Unlock SIM card

1.40 Send SMS

Sending SMS messages is possible in menu *Send SMS*. The SMS message will be sent after entering the *Phone number* and text SMS (*Message*) and by pushing button *Send*.

Figure 75: Send SMS

SMS message sending via HTTP request is in the form:

```
GET/send_exec.cgi?phone=%2B420712345678&message=Test HTTP/1.1
Authorization: Basic cm9vdDpyb290
```

HTTP request will be sent to TCP connection on router port 80. Router sends an SMS message with text "Test". SMS is sent to phone number "420712345678". Authorization is in the format "user:password" coded by BASE64. In the example is used for root:root.

1.41 Backup configuration

The router configuration is possible to save by help of the *Backup Configuration* menu item. After clicking on this menu it is possible to check a destination directory, where it will save the router configuration.

1.42 Restore configuration

In case it is needed to restore the router configuration, it is possible in *Restore Configuration* menu item to check configuration by help *Browse* button.

Restore Configuration	
Configuration File	<input type="text"/> <input type="button" value="Procházet..."/>
<input type="button" value="Apply"/>	

Figure 76: Restore configuration

1.43 Update firmware

To view the information about the firmware version and instructions for its update select the *Update Firmware* menu item. New firmware is selected via *Browse* button and update the following pressing the *Update* button.

Update Firmware	
Firmware Version : 2.0.7 (2010-12-16)	
New Firmware	<input type="text"/> <input type="button" value="Procházet..."/>
<input type="button" value="Update"/>	

Figure 77: Update firmware

After successful firmware updating the following statement is listed:

```

Uploading firmware to RAM... ok
Programming FLASH..... ok

Reboot in progress
Continue here after reboot.
  
```

There is information about updating of the FLASH memory.

Upload firmware of different device can cause damage of the router!
During updating of the firmware permanent power supply has to be maintained.

1.44 Reboot

To reboot the router select the *Reboot* menu item and then press the *Reboot* button.

Reboot
The reboot process will take about 15 seconds to complete.
<input type="button" value="Reboot"/>

Figure 78: Reboot

2. Configuration setting over Telnet

Attention! If the SIM card isn't inserted in the router, it is impossible for the router to operate. The Included SIM card must be activated for GPRS transmissions.

Monitoring of status, configuration and administration of the router can be performed by means of the Telnet interface. After IP address entry to the Telnet it is possible to configure the router by the help of commands. The default IP address of the modem is 192.168.1.1. Configuration may be performed only by the user "root" with initial password "root".

For Telnet exists the following commands:

Command	Description
cat	file contain write
cp	copy of file
date	show/change of system time
df	displaying of informations about file system
dmesg	displaying of kernel diagnostics messages
echo	string write
email	Email send
free	displaying of informations about memory
gsmat	AT commend send (<i>cdmaat</i> for routers with CDMA module)
gsminfo	displaying of informations about signal quality
gsmsms	SMS send
hwclock	displaying/change of time in RTC
ifconfig	displaying/change of interface configuration
io	reading/writing input/output pins
ip	displaying/change of route table
iptables	displaying/modification of NetFilter rules
kill	process kill
killall	processes kill
ln	link create
ls	dump of directory contain
mkdir	file create
mv	file move
ntpdate	synchronization of system time with NTP server

Continued on next page

2. CONFIGURATION SETTING OVER TELNET

Continued from previous page

Command	Description
passwd	password change
ping	ICMP ping
ps	displaying of processes information
pwd	dump of actual directory
reboot	reboot
rm	file delete
rmdir	directory delete
route	displaying/change of route table
service	start/stop of service
sleep	pause on set seconds number
slog	displaying of system log
tail	displaying of file end
tcpdump	monitoring of network
touch	file create/actualization of file time stamp
vi	text editor

Table 75: Telnet commands
